> the TNC is running in Host mode or command mode.

Gary is right on the mark here (so to speak). Host mode defines the
interface to your computer - not the interface to your transceiver. But,
there may be another source of confusion.

Without host mode, management of multiple logical data streams is left up
to the user. It is very easy to believe you are monitoring the HF rtty
stream when you are actually monitoring a VHF packet stream! That may be
why you see no "noise" on your terminal mode display. Host mode programs
(like KaWin, and Gary's XPKAM) do away with that uncertainty.

73, and have fun with the HF digital modes.

How do you damage the reputation of a Lawer??????????????????????

The only difference I know between a Lawyer, Politician & a Crook is:

1. A politician is Lawyer, who is usually a Crook, who must be elected
to screw the public...

2. A Lawyer is a Crook who knows how the system is used to screw anyone...

3. A crook is a person who hasn't figured out how to become a lawyer or
politician - YET.....!

5852. Stuck setting up Linux for AX25

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-11 00:00:00 UTC
From: fiz <fiz@lamar.colostate.edu>
Message-ID: <32874274.1492@lamar.colostate.edu>
Source record: 33744

Hi,

I've been trying to set up AX25 in Linux and have ran into a brickwall.
I'm following the AX25-HOWTO (dated 14 June 96) and have gotten to step
6. I have an /etc/ax25/axports file with the first line

145 KG0YG-1 1200 255 2 145.770

and type

axattach /dev/ttyS1 145

At this point I get the message

AX.25 port 145 bound to device sl0

So far so good. The next step is to try to make a connection using
'call'. I type

call 145 WK3S

Now I get the following messages:

axconfig: port 145 not active
call: no AX.25 port data configured

aaarrrggg, any ideas?

ttfn fiz (KG0YG)

Loads of stuff deleted....

If I remember rightly you have to have a nrports file to use vanilla AX25.
That is netrom ports.

I can't remember the format. Maybe it's the same as axports.
The axports file is for tcpip.

If you need more help I'll bring my configuration files in.

Regards J.

after axattach you need type
ifconfig sl0 ip_address_of_sl0

If you use script:
axattach /dev/ttyS1 145
sleep 2
ifconfig sl0 ip_address

FYI FBB for Linux should be available soon, and unlike Darryl, Jean-Paul is:
i) contactable,
ii) willing to listen to good ideas.

>If anyone can give me his *current* email address, or, help me with the
>following points, I'd be appreciative.

<RANT>
Darryl is *very* difficult to contact, and does not offer good support for
his BBS which is unacceptable, he should release the source code and then
you would have a number of experts within a short period. Bugs would be
fixed better too.
</RANT>

I suggest you subscribe to the Linux-Hams mailing list as that is the
primary support forum for Linux and amateur radio, there are a number of
LBBS users on there.

To join it, send a message to Majordomo@vger.rutgers.edu with the body of
the message containing:

subscribe linux-hams
end

Then send your request to linux-hams@vger.rutgers.edu, they're very helpful.

5868. Help on APRS with KAM+

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-12 00:00:00 UTC
From: dwthomas@erols.com
Message-ID: <56b0k7$adl@boursy.news.erols.com>
Source record: 33615

I am trying to get my KAM+ working with APRS, Version 7.4. I have tried older versions and and they all do the same. I am trying to get it to go into the HF mode. The software receives the packets and everything fine, it just won't transmit. Do I have to have my VHF radio hooked up with it also? The VHF part seems to work just fine. I have tried the ALT-S, the Controls menu and setting up 2 port and selecting HF also. When I hit the tab key, the screen says 2*HF. I have tried just HF and nothing else seems to work. When I try to send a beacon, the screen says ..transmitting... but nothing happens. I am using a ICOM 738 and it works with the KAM+ fine with all other software, like Hostmaster and others. I noticed that if I go into the Operations menu and athen into the cmd. mode, I can set the beacon to transmit every 1 minute, and the HF rig does transmit packets, although I don't know what they are, I assume that it is the beacon. Then I can go back and shut off the beacon. and everything continues the same. Am I missing something? Can I use the APRS software just with the HF rig?

For a good reference about 56k baud packet radio operations...
connect to the following web site here in the Atlanta area:

www.wa4dsy.radio.org

Dale, WA4DSY, is the creator of the 56k packet modem and has lots of
useful information on how to order, technical specs., and other weird things
about the 56k packet modem. When you connect to his www site you will
notice that his web link is via that 56k modem to the internet. Check it
out...you'll love what you'll see

Dave,

My suggestion is to check out this web site here in the Atlanta area
here in Georgia:

http://www.mindspring.com/~rwf/aprs.html

APRS is really big here in the Atlanta area and this web page should help
you out for the right information.

Probably the company with the largest inventory of packet equipment
and best prices in the LA area is Ham Radio Outlet. They have a store
in Orange County, near Disneyland on Euclid Blvd. Ask for Dale,
KB7UB, he is very knowledgeable about packet. HRO has a homepage at
http://www.hamradio.com . Dale's page is at http://www.bono.com/bubba/

ftp://ftp.simtel.net/pub/simtelnet/msdos/hamradio/sbfft11.zip 1032518 bytes

sbfft11.zip Sound Blaster spectral display and filtering

Features:
* Sound Blaster 16 (or 100% compatible) input and output.
* Band widths of 2K, 4K, 8K or 16K Hz.
* Spectral resolutions of 1 Hz to 16 Hz per pixel.
* Display of power spectral density with any of 4 color maps in either
linear or logarithmic scale.
* Define and use as many as to six filters simultaneously -- band pass,
band stop, low pass, and high pass.
* Filters are defined graphically by mouse movement based upon
the displayed spectrum. Once you see a signal, you can
quickly define a pass or stop filter around the signal by clicking
and dragging the mouse.
* Net filter passband is displayed at all times.
* Filters can be selectively enabled and disabled by a single
keystroke.

Special requirements: DOS 3.0 or higher, SB16 or 100% compatible, SVGA,
VESA modes 101, 105, mouse.

Copyrighted Freeware. Uploaded by the author.

I would not worry about settling down with any one package.

I use the APRS package sometimes and I use the plain old Windows 3.1
terminal program others.
The terminal program works well when I configure the function keys to
connect to the local PBBS or DX Cluster. I labeled the key with the
purpose and frequency so it is quick.

If you have a radio with a remote (computer) frequency control, and a
custom terminal program that works the various pieces of packet
infrastructure and tunes the radio, that would be ideal.

I think the best has yet to be written. Most DX and Contest hams
around here switch programs to do DX Cluster spotting and Contest or
DX logging at the same time with multi-purpose logger/packet
programs. Some of these add remote interface to the HF rig.

5880. Good modem for satellite work?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-13 00:00:00 UTC
From: Chris Lewicki <chrisl@seds.org>
Message-ID: <56c36c$104c@news.ccit.arizona.edu>
Source record: 33627
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

Hello,
Our ham club is setting up a satellite station and we're going
to be purchasing a modem to replace our twitchy pac-com 1200 BD psk
modem. As for criteria, we'd like to be able to communicate with
everything up there, possibly including Wefax, as well as be able to
expand it to 56Kb/s at some point.
I'm not too familiar with how the different modems work (as
far as the separation of TNC and modem), but I'd like something that
has one line to the radio, and the other to the serial port on the
computer. Capability to use under Linux is a boon.
So, from what I've gleaned from various publications, these
are the ones I've been looking at:

AEA DSP-2232 (or 1132)
TAPR DSP-93
PacCom Spirit 2
AEA DSP-232

Out of these, I've only had a chance to play with the TAPR modem, and
even though I couldn't really get it to work, I kinda liked it (I'm
sick that way). I've heard some people say that it isn't "completely
finished" yet, but I may be willing to wait for completeness if it
works in some fashion now. The fact that TAPR is just down the road
(I'm in Tucson), make it a bit more attractive, and the extra $500 I'd
save compared to the 2232 can go a long way towards something else for
the station.

I like the "dual-port" capability of the 2232, but I can't say I'd use
it sooner than a year from now.

I know the Spirit has 56KB capability off the bat, so that's a plus there...

No idea about the DSP 232.

Any other ones out there I'm neglecting?

I'd be gracious to hear people's experiences or suggestions with any
of these modems.

Hi,

I'm still trying but haven't gotten it figured out yet. I forgot a couple things in the original post. I have Linux 2.0.0 and I think the ax25 utils are 2.0.12 (whatever the current version is).

I have a nrports file but editing it doesn't seem to make any difference. I don't have netrom support compiled into the kernel, and can't figure out how to load it as a module (probably because it was never compiled as a module either).

I do want to set up TCP eventually but have to get Linux talking to the radio first. Adding an ip address to either the ifconfig or axattach commands doesn't seem to make any difference.

I'm still getting 'axconfig: port 145 not active' when I try to connect to another system with 'call 145 WK3S'. port '145' is defined in /etc/ax25/axports. I'm wondering if the problem is Linux isn't seeing the TNC, maybe because of an unknown irq conflict, or the TNC not setup correctly, or _____ (fill in the blank with your favorite Linux problem). Could someone try unplugging their TNC from the computer and see if 'call your_port KG0YG' gives an error message like mine. I'm wondering if the software sends a command to the TNC and is not getting the expected answer back. Somewhat like sending 'AT' to a modem and not getting 'OK' back.

still baffled,

ttfn fiz (KG0YG)

5889. Winpack, YAPP & KPC4

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-13 00:00:00 UTC
From: j_eyes@globalnet.co.uk
Message-ID: <56dcr9$41b@news-feed3.globalnet.co.uk>
Source record: 33636

I am having problems with YAPP transfers with a KPC4 that I have
recently acquired.
This is the scenario, during an outgoing Yapp transfer the PC will
send 2750 bytes to the tnc. That will be sent by the tnc to the
recipient.
Next the PC will top up the buffers, by sending a further 1500 bytes
to the tnc. A short while after that, I will get an error msg that
reads:

`The YAPP transfer has failed. Error msg is "Cancel" was received from
the sender'

It seems that the bbs is reporting a checksum error in one of the
received packets. I am unable to ascertain if this is in data from the
"top up" of the tnc buffer, or if it is corrupting data already rxd by
the tnc, during the top up.

The KPC4 is running v3.06 firmware, Winpack version is v5.53, the KPC
is running hardware hand shaking, with a fully wired serial lead,
CTS/RTS/DSR/DTR etc.

The parameter set used is basically the KAM set, with the unnecessary
commands removed. Timing params are: MAXframe 4, PACLen of 128, the
streamsw characters are disabled.
I have tried various settings of paclen and maxframe, to no avail.

Winpack is running under Windows 95, on a 16550 UART serial port, at
4800 baud. I have also tried altering the buffering for the port, this
also made no difference.

Now am I missing something, or do I have a faulty KPC4?
Coz I've run out of ideas! :-)

Hi,

I've tracked the problem down to ax25-utils-2.0.12 and Linux 2.0.0. They don't play well together. I found ax25-utils-2.0.12a and immediately got it to work. Maybe the keeper-o-the-howto could put a pointer to the ax25-utils part of the HOWTO to a more useful site than sunsite and ftp.inka.de, ie

http://www.cs.nott.ac.uk/~jsn/

So does this mean there are IP gateways on the net that will allow access
though trusted IP addresses to the Ham side? If so who are they and is
there any info available to set it up? What software would I use for the
gateway and mail server? I have here a home a small network that could be
used as a gateway if needed (1 station ham side, 1 station
Internet/router).

The more I'm in ham radio the neater it gets!

Source record: 33647

In article <stefans.847786995@bauv111> claude@bauv106.bauv.unibw-muenchen.de writes:
>What is the best device to read CW (the human excepted) ?

Try fftmorse, available on the usual ftp sites. It uses your
soundblaster card to sample receiver audio. A FFT is used to
find the Morse signal, and a simple speed adaptive algorithm
turns that into text.

The program uses fairly crude algorithms, the FFT binning is
crude, the threshold slicer isn't adaptive, and the element
to Morse algorithm is only adaptive to speed, but full C source
comes with it, so you can jazz it up as much as you like.

None of the commercially available decoder boxes I've tried
do a good job on human sent code because the only adaptation
they do is for sending speed. Most of the programs out there
use a *first* match algorithm to decode Morse, using a static
lookup table. That doesn't do a good job on ragged fists.

What you really want is a program which "copies behind" and
strives for *best match* over a number of code elements. This
involves a cross correlation algorithm running concurrently with
a trellis-like decoding matrix whose weighting is constantly
updated as the program learns the sending style of the person
being received.

This is somewhat similar to the approach used in chess programs
to search out a move strategy. (There are probably more elegant
approaches, but today's PCs have enough horsepower to make this
one fly.) I'd like to see more effort put into this because machine
Morse decoders don't have to be as bad as they are.

Actually both ends can be accomplished in a single computer, using one
of the xNOS variants or Linux.

See http://minnie.cs.adfa.oz.au/Gateways for information on
radio/internet gateways.

The param commands are for after you are in KISS mode. In JNOS, the
commands 'comm ax0 kiss on' and 'comm ax0 restart' will work after you
first attach the port.

Even better is to get a KISS-only eprom.

Yep, that's right, ampr.org is a real fully registered domain.

Most ampr.org addresses are not routed from packet to the
wired side of the internet though. The FCC rules put the
responsibility for the content of packet transmissions on
the first station to transmit them in the ham bands. I would
not want to run a wide open router knowing that at any time
someone anyplace on the internet could send illegal (for
amateur radio) traffic to a node routed through me that
could put my license in jeopardy.

It is fairly straight forward to implement a router from
wired internet to packet internet but until the rules
change I don't think you'll see it happening very often.

I don't know, but you might try downloading Visual PacketPeT from my Web sight below, and see what kind of results you have with the Yapp transfer. Just a thought...

That argument does not have a great deal of validity. Just because
something is free, it does not excuse shoddy workmanship.

This, of course, is the old, familiar argument which is traditionally
used to excuse incompetence and stupidity on the part of RSGB
Committees, QSL Sub-Managers, etc ..... "The people doing the job are
unpaid volunteers", goes the oft-repeated refrain, "so nobody has any
right to complain about unsatisfactory service".

Heh, heh. Now there's a thought. There's no speed limitation on
OOK Morse on HF amateur radio. Instead of poking along at 300
baud, we could have Morse BBS systems relaying traffic at
1000 WPM in machine Morse. Of course we'd need a really good
CNR to get away with that using OOK. High power amplifiers and
big antenna arrays would be de rigor.

It'd be ugly, inefficient, and backward, IE just what amateurs
seem to like, lets do it.

Or, more mundanely, we could add a user interface to our BBS
systems that used manual OOK Morse. That'd limit throughput
to under 20 WPM on average (probably *way* under 20 WPM), and
relieve a lot of the load on the forwarding system due to the
reduction in traffic. It might force some amateurs to clean
up their ragged fists too. I'd like to see this work in a
CSMA network, it should be a hoot. And imagine hand keying
the TCP/IP header on every packet and doing the CRC in your
head. Heh, heh, yeah, a riot.

On a slightly more serious note, the russian hamsats have
a robot QSO generator which works with Morse, so the idea
isn't totally impossible, just a huge step backwards.

Not that I know of. But for the luddite who will not have a computer in the shack, I have seen RX only TNCs which monitor the local DX cluster and relay the spots in Morse Code !

Announcing NEW Ham Radio.FAQ

This file started as a regular USENET posting called "rec.radio.amateur
.misc Frequently Asked Questions".

The evolving file was distributed far and wide thanks to passionate
contributors. The file was abandoned in 1994 and has been resurrected
now on the WWW for currency and convenience.

Ham Radio.FAQ contains 3 chapters and many, many links to radio
related sites!

1 - Introduction to the Ham Radio.FAQ
2 - Amateur Radio Organizations, Services, and Data Sources
3 - Amateur Radio Advanced and Technical Questions

Please provide a copy of the Ham Radio.FAQ to any new or soon-to-be Hams
that you know or share with them the URL to this site:

Actually, that'd be kind of neat (in a bizzare, twisted sort of way)
to see working in action... and pretty simple to implement. Yank out
the modem, and drop in a Morse Code Modulatator/Demodulator. Not
to useful for most humans, but I would imagine a few people could
interface that way.

> On a slightly more serious note, the russian hamsats have

Or sidewards. Heck, right now the area that I'm in has minimal
(as in 0) traffic; modes are modes, it'd be nice to have a few
new users around!

Cheers-
-Mike

Not at all. It'd be a great way to check mail from Field Day or
whatever. I really don't want to lug my Laptop (or palm top) plus
tnc, etc, etc to to check my mail. What'd be nice is to do is
just connect to the board, and read mail that way. As a side thought,
those people who still have the C64's and the CW interface could
connect just like people with real TNCs.

> Actually, I suppose it could be done, along the lines of the CW robots on

Does anybody know if there is source code for the robots?

On a side note: can one hook an ascii terminal up to JNOS and access
the command line from there?

Cheers-
-Mike

Mike's Curtis's 9600 Baud Packet Handbook is a good place to start.
Get it from ftp://ftp.tapr.org/tapr/general/9600baud/96man2x0.txt

In general, crystaled radios and synthesized all-mode radios work the
best. Most of the other synthesized FM radios work, but not very well.
They may say "data ready", but they're not.

Many of us are using either TEKK radios or surplus commercial radios,
eg. Motorola Micor or Mitrek. Mod instructions for these are available.

If you REALLY want to try this and will condescend to work in lowly DOS,
I think it can be done as follows!

On the 12 page single spaced TO-DO list at 88 lines per page for me out
here at W5WQN is *EXACTLY what you propose... >:)

I've actually gotten quite a ways toward it on PACKET, just not with the
CW option, quite yet.

READ ON, there is at least ONE MORE questionable fool out here!

Believe it or not the old OPUS BBS system for lan-line dial up has a
BLIND user interface! I've never used that, and it isn't well documented
in the 500K tech specs or the 500K odd user specs. OPUS is the old
sucessor free use BBS system that followed the original FIDO software by
Tom Jennings when FidoNet was first put together '84 or so.

It may or may not be necessary to use the blind reader for driving the
TNC. I haven't had to find that out yet, but if it DOES need to be done
the old OPIE will do it, I *THINK*...

Insanity takes MANY forms! :)

OPUS is a script compiler driven system, not easy to use or learn, compared
to modern BBS packages, but it had things it could do ten years ago the are
"newer" ideas today, including full remote command script driven menuless
operation. It can be totally operated remotely with NO menus at all!

This curiously WAY WAY advanced feature that is in it is called "FULL TILT BOOGIE" which permits you to script the entire session between a remote user and OPUS using a total bash of <CTRL (choose letter)> and <ALT (whatever character)> is needed. OPUS doesn't care where the input comes from at the port, just so that the characters *ARE* there which are the right ones. If they came from a land line mode, fine. If they came from a TNC modem, fine. Who cares if who knows? Right?

All that is needed is going to be the pacing that the Blind Reader might do for you that will produce the "read" letters that can then be passed to an MFJ-1278 multi-mode TNC for the CW Interface. More on that shortly- stay tuned.. :)

I still use OPUS in a DOS VDM session in OS/2, although one day I'll likely switch to MAX which grew out of OPUS years back when OPUS never got ported to OS/2 et. al. I have been able to make use of the FTB remote script operation in other uses. That is one reason why I am still running OPUS as it is tightly interfaced into other things I am researching.

There is a PBBS batch file that appeared a LONG time ago from a ham in Lousiana that can be used to drive OPUS from a TNC that does work. The OPUS program HAS been used as a PBBS packet system. As you can guess, the larger menu and complexities of such a system means that to make anything of this mess, one will has to chomp down the menus to get a KISS'y attitude for PBBS.

I *THINK* I can see a way, theory wise, to enable the BLIND READER flag in OPUS to do exactly what you wish! By VERY carefully re-writing and re-thinking the menu scripts and passing the stuff through an MFJ-1278 multi-mode TNC, I *THINK* you can get this job done! I know that the user interface *CAN* be written for that because I've done it and use it every day as part of the ZIPLOG system that runs my whole station. It has has a complete CW interface that the MFJ runs with over the air that can actually do a good job of reading the code, if the sending is half way clean.

There actually may be a way to pass only the characters without the pacing from the blind reader and just let them drive the MFJ-1278.

I researched ALL of the available multi-mode TNC's except the HAL unit, which I couldn't support because of its screen line width restriction, before I bought the MFJ-1278 unit. At the time I did this, the MFJ-1278 was the only one at all that had the CW WEIGHT setting deal properly figured out and also the ONLY one that actually could be driven in FULL QSK at 50-60 WPM. The only people that are writing code for the chipsets that seem to really know anything at all about practical operation on CW happen to be MFJ! The W5WQN site is FULL QSK from an MFJ-1278 even at 60 WPM, although you do lose the buffer when you punch the backspace key to stop the racket so the other guy can break you!

Since "reading" this code is going to be the toughest part, as long as the I/O came from someone that was sending code that could be "read" by the MFJ-1278, I can see how to actually get this *****INSANE***** job done that you propose....

Actually the 117/3000 FidoNet site is a "private" node list number for one reason in that it HAS such direct access from dial-up, but NOT as a CW machine, only through a packet/FidoNet gateway. Don't bother to try that for the simple reason that the Internet/packet route is much better and already well done in JNOS w/BPQ et. al. As I see it, all such phone number accessible direct-air links have to at least ride behind unlisted numbers and password access if you want to keep your ham ticket and about $8000 worth of fines... :)

Your desire to read your mail at FD is a little late! Two years ago from FD at the Bryan Amateur Radio Club (BARC) site, under the call sign N5TC, the West Gulf Division ARRL Director's call, used all of the fully networked suite of code from ZIPLOG to do a heck of a lot more than just read my mail while at FD! My ZIPLOG suite is an entire professional business and facility management operation for medical records, broadcast station traffic management that, by ?accident? I happen to have linked to W5WQN. I figure if it can survive a networked mult-op HF contest operation intact, there won't be any small sized clinic you will ever see that can trash it!

At FD we had the ENTIRE professional Callbook database on line and NOT in CD-ROM, but dumped to disk in a research project with the editor's blessing. The entire Callbook was autoslaved to a full networked BTRIEVE 6.1.52 facility managment file based system that was ALSO linked to the FIDONET land line operation!

Incidentally, it takes a while to read in the CB database into the full BTRIEVE database! The first year we did it because I couldn't get a TSR code routine to read the CB files. We had to use the SAM's version which I could extract to disk for test, so we went into battle with only 750,000 people in the BTRIEVE database instead of the 1,750,000 that I wanted.

The second year I got my code from Ted Miles for the CB read. We then could dunp the CB direct to disk and use BTRIEVE in my professional code to only build the hits, not the entire facility in advance! That gave us the ablility to check how we could really process "registrations" of refugees, not work as if we had access to millions of them pre-built.

As soon as anyone in the crew logged in a hit in the log, instantly, when the QSO was done, a thank you message was stuck into the FIDONET crew's "disaster relief" routing queue! That system generated message was a QSL card letter and a brief customized explantion text for each different call of how the whole deal worked! A FIDONET member here, working side by side with the crew, then matched the HOME QTH of the call being used to the nearest GEOGRAHICAL FIDONET BBS site they could find! We had paired up the entire CB routine with a full custom binary tree lookup of the FIDONET system in the same database! First you see if you can get a common city between BBS and QTH. If not, try geographical coordinates on a map for the nearest big city and go with that one for the search for the closest BBS! The auto-QSL FIDONET message was then HUB routed through the FIDONET system to the SYSOP of the closest BBS to that ham's station, along with a nice information message asking if the SYSOP of the FIDONET system would call the ham operator and deliver the traffic!

We sent out some 1200 FIDONET QSL cards from that operation that way.
These messages were routed through the local FIDO hub, Skeet Masters at
117/100 and gated to Bruce Bodger up at the TRUCK STOP in Tulsa,
where they were busted out of the mail packets and then delivered, a
couple world-wide as the site has a few international hits in FD each year!

The key FIDONET crew all got certificates of appreciation from the ARRL
for showing how it could be done! Ruth Grove, the local 117 NC at the
time, who "manned" the criss-cross position at addressing for us, was
absolutely STUNNED at the data flow during runs on CW! Her eyes
repeatedly kept getting glazed over and she kept saying, "AWESOME",
sort of mumbling it, as we were hitting 120 contact an hour rates during
the runs on 40CW at the appogee of the path, which is typical for
a good contest station at the height of the frenzy.

I got back about 50 FIDONET messages at W5WQN from the FIDONET side
of the system in reply to the blitz of which only ONE was negative in
attitude. I'm glad not all 1200 pushed the reply button!!!

At the same time all this was going on networked in REAL-TIME, each
hit in the log was generating a complete full business charge and time
management case portfolio in ZIPLOG for emergency medical and case
management. The system, which was set up in two hours FD morning,
capable of handling some 50,000 refugees with the server, piling
up their complete "aliased" addresses, billing information, drawn into
the system out of the Callbook data, indcluding total POS inventory
control and Case management pointers. Messages, log info, routing,
et. al. automatically goes into the case file, just like a medical chart!

We found out that it would have taken about a complete terminal position
on the ZIPLOG side for each 1000 people processed to the hospital or
the relief operation, just from the data that was being fed into it from the
"disaster" refugee line, the contacts that were hitting the log from FD!

There isn't a hospital or relief crew operation of any kind in Bryan or Colllege
Station that could have BEGUN to keep up with the data out of this ghoul!
We also discovered THAT little fact. In fact, although we had the full
communications suite with "HF" links that could do it, the entire medical
community couldn't have coped with more than a few hundred hospital cases
and the disaster relief shelter system could have actually handled only about
6,500 total refugees in the pileups! To date, none of the hospitals or the
officials have ventured forward to take our offer to test forward "refuggees"
to see what they could do with the data flow. This same sort of glazed
stare developes on people from these places that tour the site....

:)

Using "refugees" generated by the logging system for the data, we would
have TOTALLY, in theory, absolutely destroyed the entire medical communities'
ability to "respond" to this contrived "disaster" with just our little old 2A
entry in FD at BARC.

ZIPLOG didn't care much at all. It currently has over 60,000 case records
on line over about six years worth of service in places. FD is trivial to it.

Full service double-entry bookeeping, case management, supplies, the whole works. We could have, if the work were "costed" out, have generated a complete double entry bookkeeping income statement and balance sheet...

after EVERY contact.. in real-time...

except for the depreciation and those kind of things. :)

Every drink of Gatorade, every blanket, every $5 bill advanced and everything...

FIDONET couldn't have cared less about 1200 messages. The entire packet traffic took less than three minutes of the HUB's time.

All it takes to read your mail on FD is a good 9600 baud packet port and a realtively normal BBS system that isn't bogged down in GUI glue!!!

Now in CW... YES THE THOUGHT HAS CROSSED MY MIND..

However, insantity takes MANY forms...

YOU may want to read your mail during FD.

I wish to generate enough traffic to BREAK things.

It is more fun!

>using the soundblaster?

No, but there is various freeware to do this. Names include FFTMORSE and
DSPMORSE. FFTMORSE won't work unpatched on the 8 bit SB Pro. Both are
supplied with source code.

Note that these programs only seem to be good for reasonably interference
free, non-fading signals. Recovering morse of real HF bands is a difficult
problem. I did try enhancing FFTMORSE a while ago, but only improved it
slightly. I'll maybe try again, but on Linux, not DOS. NB please state
the operating system when asking this sort of question, although it is a
reasonable assumption that Windows is a bad choice - you need DOS or a
pre-emptive multi-tasker, like Unix, and maybe NT.

5943. Our Purpose: Amateur Radio

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-16 00:00:00 UTC
From: dick@tmh.ORG
Message-ID: <96111650464@tmh.org>
Source record: 33556

I see a lot of discussion here that leans toward the viewpoint that ham radio is justifyable only if it is on the leading edge of radio technology. The context of these comments usually is with emphasis on

digital technology.

Certainly ham radio is a platform for experimentation and indeed does "... contribute to the advancement of the radio art."
That's Part 97.1(b), but only one of the five purposes of the Amateur Radio Service as defined in Part 97.1.

None of the puposes described here requires that the Amateur Radio Service
prove it's worth by defining the edge of technology. On the contrary, we, without pecuniary interest, cannot be expected to produce new technology. It is in spite of that handicap, that we sometimes do.

We are characterized as a volunteer service, expected to do nothing but
develop our individual technical skills, our radio operating skills, be
friendly when we chat with hams in other countries and just be available.
In so doing, we "contribute to the advancement of the radio art."

I think this simply means that we should employ any radio technology at our
disposal to help us develop those skills. When a new ham builds a CW transmitter, he is meeting the purpose of the Amateur Radio Service. When
he uses it to communicate in morse code, he meets this purpose. Whether
he builds antennas or chirps via "CLOVER" around the world, he meets this
purpose.

Now to carry this a bit farther, I think this also means that we should be
moving away from inefficient technologies, AND PRACTICES, particularly those
that waste valuable spectrum. I'm thinking of the use of FM to carry voice and digital information. I'm thinking of willy-nilly packet backbones
that fill the 2-meter band in some areas with endless duplications of bulletin traffic. Having spent most of my 46 hamming years on HF, it seems

to me that our use of VHF is extravagant. With just old SSB
technology,
we could accomplish much more on 2 meters with less than half the
bandwidth. That's great place where we can earn our salt and
"contribute
to the advancement of the radio art."

Just because we've "always" had the use of a band of frequencies
doesn't
mean that we should continue to have that use. Our use of them can be

justified only on the basis of our need of them to carry out our
defined
purpose.

If we narrow our purpose toward something we cannot produce, we reduce
our justification for use of spectrum we now have. But if we keep a
true perspective of why we exist as hams, we will be be able to
continue
to do the things we are doing. We will be able to continue providing
voluntary communication service and "expanding the existing reservoir
[....] of trained operators, technicians, and electronics experts,"
etc.

73,

Dick - W7DHS

Greetings!

E-LAB Digital Engineering, Inc. is pleased to make freely available our new
Electronics Internet Resource Directory!

This directory is a collection of many internet sites of use to
electronics builders, designers, and engineers. It is divided into
40 categories, with each category containing many hot-links to companies
and/ or web pages containing information on topics from Compilers to
Code Examples to Components Distributors.

The directory is available at http://www.netins.net/showcase/elab
You WILL want to set a bookmark!

We also invite you to check out our products, such as our new line of
integrated circuits for embedded design.

Thanks,

Todd Peterson

Due to other obligations and the worst case of the flu virus in 23 years, updates to our Ham Radio Online web site have been a little slower than normal this month. But we are still busy adding new stories:
- just added an overview of GPS and GLONASS navigation technologies
- We've republished an excellent article from Richard Perez of Home Power Magazine detailing what happened with lightening blew out radio telephone service and started a forest fire - and the surprising role that ham radio operators played in controlling the fire.
- For history buffs, we're running a story on the importance of Morse Code back in 1871 during the Great Chicago Fire.

And as usual, we have real-time propagation and aurora condition reports, disaster situation reports, equipment info, links to other sites, and so much more.

Ham Radio Online is a self funded, classy online "magazine" devoted to ham radio. Stop on by and enjoy at http://www.hamradio-online.com

We should be back to our regular update schedule very soon.

5952. 150MHz FM, 100mW transmitter circuit wanted - please help

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-16 00:00:00 UTC
From: erazmus@wantree.com.au
Message-ID: <56jvec$vkr@news.wantree.com.au>
Source record: 33689

Hi,

I'm looking for a schematic for a 150MHz FM transmitter for 100mW output, running off a battery DC supply from 5V to 12v and want to modulate the transmitter by a bitstream generated by a PC or micro and either for telemetry or paging the kids at the bottom of the garden !

Anybody know where I can find a schematic for this ??

Given the recent overload in news-groups could some-one email me ?

Rgds

Mike

Yeah, I've gotten a couple of responses to this so I tweeked it a bit but still not sure if it's any better, I think I need to make my main banner smaller as it seems a bit large I will work on this hopefully this weekend and see if it gets better. I'ma bit spoiled as I have a fast dedicated connection so I move stuff through rather quickly. Sorry for the inconvenience folks :)

>the sender'

Certain TNCs, when used in transparent mode with Win95 and a PC fitted with a 16550, appear to suffer from overrun of their input buffer when the TNC goes busy. I've personally experienced it with both a KPC3 and a KAM. Tests showed that I could send the same data and lose exactly the same one or two bytes every time.

If you reduce the link speed between the PC and the TNC to 2400, you'll find the problem goes away. Assuming you are running at 1200 bps "on air", you won't lose any performance by doing that.

I've also been told that disabling the FIFO on the UART by using using the Advanced Port Settings in Device Manager also cures the problem, but I've never tried it.

Are you sure it's relative to the alphanumeric's - reason I ask is because a similar thing happen's to one of my boxes running LBBS 0.18B but this is down to the actual size of the compressed FBB code blocks. Seems that anything MUCH over 10K gets LBBS really upset with the same results as you.

Is there a newer version of LBBS, I asked Darryl a while back when the flock() problem cropped up and he was working on it then but I've heard nothing since.

As Jonathan says, there will be a Linux version of FBB, which is in beta now and rather good already. Some nice perl scripts and shared newspools should be possible.

Cheers, Martin.

There is a Shareware ver. of the soundblaster CW software on QRZ CDrom,
also on some of the hamradio FTP sites.

It's also fairly easy to set up a gateway to accept only traffic from
44.xx originators or specific "trusted" hosts.

>interface that way.

It'd be a real case of John Henry versus the steam hammer all right.
It might spur some development of better Morse decoders, though,
so it wouldn't be all bad. As I noted in another post, the current
state of machine decoding of hand sent Morse is very far from what
is possible to achieve.

>> On a slightly more serious note, the russian hamsats have
>> a robot QSO generator which works with Morse, so the idea
>> isn't totally impossible, just a huge step backwards.
>Or sidewards. Heck, right now the area that I'm in has minimal
>(as in 0) traffic; modes are modes, it'd be nice to have a few
>new users around!

Well, yeah, there's that. Any activity is better than none I suppose.
My fancy has been struck by the idea of very fast machine Morse for
HF forwarding, however. Machines already do a good job of decoding
machine sent Morse, and the rules don't put a speed limit on Morse
usage on HF. That's a possible way around the current 300 baud limit.
I recall some amateurs experimenting with this a few years ago, but
they weren't using an error detecting and correcting protocol, so
what they mostly got was garbage unless conditions were very good.

You're looking at a Morse signal that's nearly 12 kHz broad at
1000 WPM, however, and that'd be a nightmare on the bands. You
couldn't use a narrow filter (obviously), and even DSP couldn't
form a matched filter around the signal because it would be non-
uniform, and hence energy prediction algorithms wouldn't work.

And you'd need a very special CW transmitter to key that fast
too.

It's a pretty problem, and we might have to face it if we can't
get the HF digital rules reformed, but there are certainly more
efficient (and more friendly to other band users) ways to do high
speed data than OOK Morse.

Hello.
I've just updated my FTV program, which does FAX & SSTV using a SoundCard, to decode Baudot using the same (FM) demodulation engine.

Here is a run down of the more interesting features:

(1) It keeps the demodulated signal in memory, so that the signal can be analysed again at a different keying rate or polarity! Garbage can be resampled on the fly, which means that minutes of received signals decoded at the wrong baud rate or keying polarity are recovered, on the fly, while still receiving.

(2) Keying rate and polarity are analysed automatically - standard baud rates are automatically set following analysis.

(3) Tuning oscilloscope available at all times, without loss of copy.

(4) Program works in real time.

(5) I wrote it, and I love it - I myself can't believe it works so well!

Download your copy of FTV from my web site, at:
http://www.geocities.com/SiliconValley/2504

System requirements, and the standard features of FTV are described in the following page:
http://www.geocities.com/SiliconValley/2504/ftv.htm

By the way, AM signals from low orbiting weather satellites are also decoded - no extra interfaces needed. Demodulation mode is user selectable in software.

Hope you all have a load of fun receiving 'words and pictures' - I hope to get some feedback !

All the best from Brian, 9H1JS, on the Island of Malta.

5963. Low cost 1.2GHz packet?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-17 00:00:00 UTC
From: pcr@ic.net
Message-ID: <56lu1h$2ib@news2.ic.net>
Source record: 33562

It occured to me that a way to build an inexpensive packet backbone link on 1.2GHz would be to take an existing 9600 baud 2M FM radio and run it into a Down East Microwave transverter. Is there any reason this wouldn't work?

Hi,

That's a TCM3105 (not 1305) and it's a fairly standard
IC from TEXAS INSTRUMENTS that you should be able to
find at any good compoment shop I think.

Never heard abt clone board here ?. As far as I
remembered, they stop making and stocking them,
just doing batch on order.

Hope it help,

I was just wondering if anyone has come across a message filter for TstHost, one is mentioned in the doc's on page 43 of the english doc's but as yet I have not found the programme refered to.

Any pointers as to where I might be able to find it from would be very welcome indeed.

Cheers for now,

Hi and thanks for reading this. I hope you can help me figure this out.

I want to key the rig from the parallel port of the computer with a logging program like CT. The rig is a Kenwood TS-830S which uses negative keying. I built a K3KU type parallel interface which should key both
positive and negative keyed rigs. When I attach everything, it imediately keys the rig.

I don't know enough about transistors to figure this out on my own in real life. If you are familiar with the CT manual. It calls for a PNP and a NPN transistor. I am using a 2N5401 and a 2N5551.

Thanks in advance
Raj VE6RAJ

T.I. quit making the TCM3105, so it may be a bit hard to find. I
remember seeing DRSI's announcement a few years ago. They were quitting
all ham products to concentrate on the more lucrative commercial market,
as I recall.

I hear about this. Pity that, apart from the above problemettes, LBBS
does the job I want. It'll be a shame to go to FBB, *but* if I can't get
these sorted, then I will.

John Kesling <jkesling@norden1.com> wrote:
>It is fairly straight forward to implement a router from
>wired internet to packet internet but until the rules

But it is almost impossible to get anyone to put backbone routes in for it. I don't know the exact current figures, but you need to be a router for something a lot closer to 64K addresses than just one for people to spare space for your route in the backbone router routing tables. To keep the size of routing tables down, routes are now effectively to ISPs, who then delegate parts of a large address block to their customers. The result is that routing is hierarchical for all except the largest ISPs.

Incidentally, is there an Autonomous System number for 44.0.0.0/8; as I understand it, backbone routes are to ASes, not to individual machines, allowing for more than one gateway to serve a block of addresses.

>change I don't think you'll see it happening very often.

I can't see any good reason for the rules to change. The basic guidelines are that the traffic must be innocuous and must not compete with commercial services. As people are clearly prepared to pay for commercial services for fixed connections I find it difficult to believe that access to the commercial internet would be considered acceptable use.

I had a go at improving some of these features a few years back,
although I never completed the job. The current version can be found
under http://www.djwhome.demon.co.uk/ (look for work in progress). It
is really only in a state for experimenters, and requires the DJGPP DOS
extender. I'm pretty sure that I put in an adaptive slicing level.
There were some other improvements that I forget.

However, it really needs to switch modes from an FFT acquisition mode to
a much narrower, tracking filter, mode for the actual decoding, and
preferably one that doesn't work in blocks but continuously generates a
function of the last n samples.

Currently it still has a lot of difficulty with real off air signals.

>
>What you really want is a program which "copies behind" and
>strives for *best match* over a number of code elements. This

I'd certainly agree with this. I did consider it at the time. (I did
make some improvements to this part of the code, as well, but forget
what they were now, but this wasn't one of them).

If I take it up again, I'll probably do it under Linux, which will mean
that I don't have to run the sample capture in polled mode (DJGPP didn't
have good DMA support at the time), but may mean that maintaining screen
displays is more expensive/involves running privileged.

:
I don't think this would be inexpensive unless you are on flat land or
are up above everybody else. Otherwise you would need a lot more
transmitters inbetween. We have a hard enough time running a 440
backbone up here bacause of the landscape. It is a good idea though
since the frequency would be able to support higher speeds especially
if your backbone people decided to up the speed later when things start
getting cheaper/popular like the 56k modems.

More precisely, 44.0.0.0 is an IP address. It happens to be a class A
address, in pre-CIDR nomenclature. For what it is worth, from the
whois database:

>>>>>> % whois 44.0.0.0

>>>>>> Record last updated on 14-Jul-92.

You are correct that the Internet routing tables contain routes for
networks, rather than individual hosts.

(Autonomous System numbers are something completely different.)

5994. What do I need for RTTY?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-18 00:00:00 UTC
From: gekko@nwlink.com
Message-ID: <56p08p$fum@texas.nwlink.com>
Source record: 33587

Hi everyone.

I have been out of ham radio for a number of years, and when I was last on RTTY, I had a model 15 teleprinter and a homebrew TU. Well, times they have a changed!

I have a 386 DX40 in the shack as my logging computer, and I would like to get on RTTY again with my Kenwood TS820, but I don't know what I need to do it.

I have heard that a sound card can decode RTTY, but I'd like to transmit as well. I don't have a clue what gizmo I need between the computer and the transmitter RTTY key in jack.

Any information would be very helpful. If a device such as a 'RTTY modem' is needed and you have one to sell for a reasonable price, let me know that too.

Thansk in advance,

Dave

5995. PK232MBX & kiss mode

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-18 00:00:00 UTC
From: Ian Wilson <ian@demon.co.uk>
Message-ID: <HLGPBGAOcEkyUwwm@flkcol.demon.co.uk>
Source record: 33588

Hi

I have been using a PK232mbx for packet for about a year now, using Winpack as the driver. Now this program is very good but I find it limited in some areas.

So what I would like to do is to get the tnc into kiss mode so I can run Superpacket. I used to run this on a Baycom modem.

I have tried the command KISS ON, but I get absolutely no response from the tnc. I even have problems runing winpack with compressed forwarding/downloading, setting the XFLOW command results in no text comming back from the tnc.

Any clues would be appreciated.

From: geneken@cris.com
Message-ID: <329044D8.7505@cris.com>
Source record: 33589

Is there any way to send control characters from the edit window in
WinPack? I frequently need to send, for example, Control-A to abort
sending a message, or Control-T to cancel a command while connected
to the BBS but WinPack apparently won't allow any characters preceded
by the "control" key to be transmitted.
Thanks in advance,
Gene WA4WBI wa4wbi@amsat.org

Good news.
Fellow surfers, you could order real cool T-shirts or/caps with
a fantastic embroidery on: the graphic is a surfer surfing on www,
embroidered like waves on the sea in the virtual world, the word
cyber-surfer is lively located on the corner of the design. The whole
embroidery creation is just a piece
of art that reflects your spirit and your feeling.(Three colors of the
design will change
according to the colour of your ordered garment.)
If you want to personalized the garments, please add one dollar to the
price and specify the fonts you like, we will embroider your name on.
If you do not care about our graphic but want a phrase to be embroidered
such as CYBER-PUNK, PUNK@WWW.NET, WILD NETTER, NET HACKER or whatever you
want, just write to us, we will make you excited.
Caps, white, black, blue, yellow, red, purple, green and
brown, with ajustable buckle one size fits all.
T-shirts, white, black, blue, yellow, red, ash and natural, with M, L,
XL & XXL.

Please give yourself a treat or give your loved one a personalized X-mas
gift!

Both the T-shirts and the caps only cost U.S. $7.5/ Cdn $9.5 including
postage (even international!)
Please order by mail with check or money order to Power Vision Embroidery
Co. The address is:

Hi Phil,

Having done what u suggest, take a 2 m FM radio, and run it thru Down East Transverters, to make a 9600 baud 1.2 Ghz link, I know there is no reason it can t be done.

But, there are some fine points. First is frequency stability. 9600 Baud .5 GFSK, ala K9NG (6 Khz shift, 3 Khz deviation) is only about 10 Kc in BW. Thus one needs a 1 Kc frequency stability. That s .8 parts per million. We spent most of our time rebuilding, ovenising, and tweaking in the Down-East LO circuit. It just barely makes that spec after allot of work. Even so, we go out and tweak things in twice a year.

Clearly, a wider BW modulation is more appropriate. Which leads us to the 56 KB WA4DSY or a 38.4 KB G3RUH modem. The 56KB 'DSY modem is clearly technically superior. But, on 1.2 Ghz its not easily implimented. There are no I/Q outputs and its onboard IF is 28 Mhz. A 38.4 KB G3RUH modem, thru a widebandwidth 2m radio should be easier to do, with the DE transverters.

Another choise is the FLEXNET radios by DF9IC. I ve recently constructed a few of these, and altho they are only 19.2 KB capable, they are full duplex, and relatively cheap. Altho they do take a allot of time to stick together.

73, Don.

Hi Dick,

While the items you site from Part 97.1 are there, they are not lumped into subcategeories of the "contribute to the advancement of the radio art" purpose. This purpose is a seperate point.

Yes Dick, that s just the issue. We are not employing radio technologies at our disposal. The activities you point out are all worthwhile, but on the non-HF frequencies, many activities are precluded by the ocupation of spectrum by old technology.

In our area here, there are not "willy nilly" use of 2 meters for back bones. Its mostly for 1200 baud access. Having operated SSB packet, as well as FM packet I know you are wrong. And rather than go to the more expensive SSB route, to improve spectral efficiency, Packet Radio went to the .5GFSK modultion, and DSY Bandwidth Reduced MSK. Both of which have similar, if not better Baud/Hz efficientcy than a 1200 baud FSK SSB technigue, and one technigue is significantly more economic. But 1200 baud FM hangs on. And its not without reason. Due to pulse noise, the other two technigues are not generally deployable. Which 1200 baud FSK SSB would have tremendous problem with. The drive is not really for narrower emisions, but for more baud rate, in packet radio. The .5GFSK is typically 9600 baud, and the DSY MSK typically used at 56 KB, with a 25 Kc, and 100 Kc channel BW , respectively.

These comments all impact the "expand the existing reservoir..." purpose. If people do not see a reason to become involved in Ham Radio, due to the stranglehold passe' technologies have on Ham Radio spectrum, we will not achieve this purpose!

WinPack version 5.53 and earlier didn't pass many control characters
through to the TNC, mainly because it was designed to be used with AX25
BBSs, and they don't normally need control characters. It is, however,
quite easy to embed the few control characters that are needed in
scripts, and make them available on function keys.

The new version 6 (released today!) passes most control characters that
are keyed into the single line tx window direct to the TNC.

The big problem is frequency stability. You'll need to ovenize the
oscillators, and probably employ some compensation too, in order to
keep them netted. AFC may help too, but that can lead to a very long
Txd as the receiving station has to acquire lock with the transmitter
of the moment before it can start to decode the packet.

Since you can go much faster than 9.6 kb on 1.2 GHz, and since the
wider signals will tolerate drift better, it would make more sense
to go to 56 kb or faster at 1.2 GHz. The WA4DSY modem can tolerate
a 4 ppm drift at 1.2 GHz, IE about 5 kHz, before the error rate
increases. This much drift at 9.6 kb would cause the station to be
uncopyable (you need to hold drift to 0.4 ppm for a G3RUH 9600 baud
modulation at 1.2 GHz).

There are other options too. The Slovenian 256 kb and 1.2 Mb data
radios use plain Manchester FSK. They're broad as a barn, but that
means they tolerate drift very well indeed. Of course bandwidth
consumed is starting to get pretty large at 1.2 Mb FSK, and the
required signal levels start to climb rather rapidly to give adequate
SNR. But you can use high gain directional antennas to address both
concerns rather nicely for a backbone.

In summary, I wouldn't bother with 9600 baud at 1.2 GHz. If you're
going to the trouble to get the signal up there, you might as well
take advantage of the bandwidth available and run something faster.
Even though you have to use double conversion to get the WA4DSY
RF modem onto 1.2 GHz, it'll still likely be cheaper and easier
than using a modified voice grade 2m radio and G3RUH modem with the
transverter, when you consider the 10x increased frequency stability
you'll have to achieve to make the latter combo work.

Using the WA4DSY modem isn't difficult. You just have to use double conversion. You can use the DE 10m->2m low power transverter (IE don't buy the PA), between the RF modem and the DE 1.2 GHz transverter. You can even use the Hamtronics TV-2 and a 2m->10m receive converter in there. You don't need TR switching in the intermediate stage since the RF modem has separate Tx and Rx ports (and you should set up the 1.2 GHz transverter's IF ports the same way). TR is only needed on the 1.2 GHz side (unless you run separate antennas, then you can avoid this too). This double conversion costs about the same as the G3RUH modem board that you won't need, and the WA4DSY modem costs about the same as a 2m rig, so costing becomes a wash, but your throughput just took a giant leap upward.

>Why digital transmission is better than analog?
>Please explain in terms of networking communications
>Thanks

Boiled down to the very basic level, digital technique is better
than analog technique because it is easier to separate a signal
consisting of a finite number of known discrete states from noise
and other channel impairments than it is to separate an analog signal
with an infinite number of possible states from noise and other channel
impairments. Digital signals allow the creation of a finite decision
tree in signal space while analog signals do not.

For a detailed explanation, I refer you to _Digital Modulation
and Coding_ by Stephen Wilson. That's the best single book on
the subject that I've found. (And the subject cannot be done
justice in less than book length IMHO.)

>transmitter RTTY key in jack.

You've got two ways you can go, Dave. You can use the sound card to
synthesize an AFSK signal and feed that to the microphone jack of a
SSB rig, or you can use a parallel or serial port status line to
toggle the FSK input of a rig so equipped, and let software bit bang it.

This assumes the rig needs a TTL input to its FSK port, most modern
rigs do. But if you need something else, you'll have to build a simple
level converter.

PTT will be handled by another status bit which will be toggled by
the software to put the rig in transmit. (Or if you decide to use
AFSK, the SSB rig's VOX can handle PTT.)

AFSK is easiest since no interfaces or modifications are required,
but true FSK often works better, and is the *only* way to go if
the transmitter doesn't do SSB.

Down East sells a model 1296-28 transverter. It has a 10 meter IF.
It puts out 3 watts at 1296 mhz and is $550.
This will interface to the WA4DSY 56k modem directly.

Hello All We Have Radio Shack PRO-2006 Scanners For Sale
Model 20-145A 120VAC and 12VDC 400 Chan
25-520Mhz
760-823.945Mhz
851-868.945.Mhz
896-1300Mhz Stock out of the box.

If you mod this scanner you will VOID any return policy
PLease if you must mod the scanner wait until the warranty is up.

Brand New - 90 Day Warranty - $350
Factory Refurb (Mint Cond) - 30 Day Warranty - $300

All scanners come with new manual and antenna and use an 9 Volt
battery for memory back up -Not included-

Shipping is FED-X 2 Day Air $15 Add $5 for COD must be Cert Funds Only

Visa and Master Cards ok but must be shipped to Bank Billing Address
or please call or fax a signed order.

Also Faxed orders welcome

Actually fairly simple to do ... with a few minor problems
(like how do you send "Line Feed" and "Carriage Return"
and "Tab" in Morse?).

Considered putting one on air in 1986, but never quite got
around to doing the TNC interface. If I did put one on air,
what freq should it use?

But of course. Didn't you ever watch the TV show "Combat" (or re-runs).
One of their WWII portable radios was in a field pack, but another type
literally WAS a tube type hand held... a LARGE handheld, but a handheld
radio nonetheless.

But for FREE????? Well, I did get a handheld radio "almost" for free.
It was a handheld receiver only (scanner) that covered the 2 meter band
(and the 160 MHz range public service band) for only $5... AND, it even
came with some crystals for the four channels. Unfortunately, none of them
were ham frequencies.

The 44.x.x.x addresses are "real" IP addresses, in the sense that
the 44.x.x.x addresses are part of the same address space as are all
other [legitimate] IP addresses.

The 44.0.0.0 IP network is announced to the Internet. I can't see the
Internet routing table entries in the core of the Internet, but I
suspect that only the 44.0.0.0 network is announced. Specifically,
I doubt that pieces of the 44 net are announced from various places
in the Internet. (Note, there were some recent experiments with
announcing pieces of class A IP addresses, of which the 44 net is one.
So far, I believe that these are still only experiments.)

The following "traceroute" from me to an arbitrary 44.x.x.x address
might provide some interesting info. ("traceroute" identifies each
router in the path between a source and destination in the Internet.
Each line in the following output is another router; my comments
are in brackets. The numbers are round-trip-times.)

> noc# traceroute 44.0.0.1
> traceroute to 44.0.0.1 (44.0.0.1), 30 hops max, 40 byte packets
[The following two routers are at my site]
> 1 [a router internal to our site] 3 ms 2 ms 2 ms
> 2 [another internal router] 3 ms 2 ms 2 ms
[These routers are SprintLink routers]
> 3 sl-chi-5-S4/4-T1.sprintlink.net (144.228.55.45) 13 ms 13 ms 12 ms
> 4 sl-chi-3-F0/0.sprintlink.net (144.228.50.3) 14 ms 13 ms 14 ms
[This is a SprintLink router at the Pensauken (NYC) NAP]
> 5 sl-pen-2-H2/0-T3.sprintlink.net (144.228.10.37) 31 ms 31 ms 213 ms
[CERFnet has a router at the Pensauken NAP]
> 6 cerfnet.sprintnap.net (192.157.69.5) 115 ms 107 ms 169 ms
[CERFnet has an ATM VC between the Pensauken NAP and San Diego]
> 7 san-atm-ds3.cerf.net (134.24.17.100) 114 ms 115 ms 108 ms
> 8 riptide-fddi.cerf.net (134.24.252.10) 117 ms 311 ms 122 ms
[And, finally the UC San Diego Campus]
> 9 * muir-gw-fddi.ucsd.edu (132.239.254.238) 189 ms 116 ms
[And, AMPR]
> 10 ampr.org (44.0.0.1) 107 ms * 96 ms

Note that because a few 44.x.x.x hosts are directly reachable from
the Internet, it does not follow that _all_ 44.x.x.x hosts are. I assume

that only a very few 44.x.x.x hosts are directly reachable from the Internet. The owner of 44.x.x.x., Brian Kantor, (located at, surprise, UCSD), could probably tell us for sure.

Disclaimer: I don't claim to know much about radio, but I have had some exposure to the Internet...

Probably more than you ever wanted to know,

Tim Salo
salo@cray.com

[I might even get my own 44 address, if I ever get a rig on the air...]

6033. Save 80% On Your Grocery Bills!!!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-19 00:00:00 UTC
From: save@grocery.com
Message-ID: <56tvo3$pmd@ns1.autonet.net>
Source record: 33533
Cross-posted to: rec.photo.technique.nature,rec.photo.technique.people,rec.ponds,rec.puzzles,rec.puzzles.crosswords,rec.pyrotechnics,rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

THIS is Your Problem!!!
~~~~~~~~~~~~~~~~~

The average American family spends approximately $400 per month on
food and other grocery store items. That monthly expense is increasing
constantly, and EVERYONE is always looking for ways to cut those costs.

Now the way that most consumers are saving money at the grocery store is
by using " cash off " coupons. In fact recent national surveys report that
90% of ALL American households use grocery coupons weekly!

But .... until now the problem has been that " coupons clipping " is a
hit-or-miss proposition at best. It generally means a time consuming,
tedious job of sorting through perhaps dozens of flyers, circulars, and
magazines, and cutting out only those few coupons that fit your needs.

National statistics actually tells us that although the typical Sunday paper
contains 100 or more "cash off " coupons , the average person manages to
clip only 3 to 6 coupons for products they really want and use.

And THIS is Our Solution !!!
~~~~~~~~~~~~~~~~~~~~

"Why can't someone invent some kind of a 'system' so a consumer could
ORDER JUST THE COUPONS THEY REALLY WANT AND USE!?"

Well, now someone has!!!

You begin by subscribing to our unique "Coupons-By-Choice" service. For
a subscription fee of just $20 per month you will receive one of our
exclusive "Coupons-By-Choice" booklets. Your monthly Booklet contains
certificates which may be redeemed for up to $100 worth of cash off
grocery store coupons that YOU CHOOSE from our list of HUNDRED
OF NATIONAL , NAME-BRAND PRODUCTS!

HERE IS HOW IT WORKS....
~~~~~~~~~~~~~~~~~~~~~~
Each "Coupons-By-Choice" Booklet contains 10 "coupon order forms."
EACH order form can be redeemed for $10 worth of PERSONALLY
SELECTED cash-off coupons. You actually CHOOSE exactly what
coupons you want from our master list which is printed in each Booklet.
You then mail the completed order form and a small handling charge to
our redemption center. In just a few weeks you will receive $10 worth of
cash off coupons that YOU chose! PLUS ... you will receive additional
coupons of your choice to reimburse you for your handling charge and
~~~~~~~~~~~~~~~~~~~~~~

your postage!

And remember that these are MANUFACTURERS' coupons for
NATIONAL, NAME-BRAND PRODUCTS, and are valid at any store that
CURRENTLY accept coupons!

So the real beauty of our system is that, as a subscriber to our "Coupons-By-Choice" service, you do not have to change your buying habits at all to receive substantial savings!!

* You do NOT have to shop at certain stores! You continue to
shop where you ALWAYS do!
* You do NOT have to purchase "special" products from special
"dealers!" You continue to buy the SAME products and brands

you do every day!

Where else can you receive a return of $100 to $200 ... on a monthly investment of only $20 !!??

THINK ABOUT IT!....

READY TO START SAVING??
~~~~~~~~~~~~~~~~~~~~~~
With regard to this particular ad, there is only one way you can get the necessary APPLICATION forms as well as more information about our company and this AMAZING opportunity:

Call fax-on-demand 512-404-1275 (must call from a your fax machine)

Remember to put your sponsor's ID number in all application forms, otherwise they will not be processed.

6034. Encryption of voice over amateur frequencies is Not legal

Newsgroup: rec.radio.amateur.digital.misc

While encryption is NOT illegal, encryption over amateur radio IS illegal,
and it's use would lead to the detriment of amateur radio. It would give
the money grabbing politians and the money paying frequency grabbing
interests of big business the opportunity for congress and the FCC to
take away yet another chunk of VALUABLE AMATEUR RADIO SPECTRUM.

*** Please read the following regarding Codes and Cyphers***

You may not hide the meaning of your communication by
putting them into codes of ciphers [91.113(d)]. In this context, codes
and ciphers refer to text that has been transformed to conceal it's
meaning. This restriction is consistent with the Commission's obligations
under international regulations that amateur communications be made
in plain language. Universally accepted abbreviations may ve used,
however, when the intention is not to hide the meaning of the
transmission; common Q signals, for example.
The rules do not apply to the legitimate use of secret
telecommand codes used to protect the security of a space station
[97.207(f)].
Also, repeater trustees can use authentication codes to secure
access to control functions of a hilltop repeater. (Authentication
codes are sent by control operators to the repeater control functions -
the repeater checks, or authenticates, the code to ensure that the
commands are coming from an authorized control operator.) Universally
accepted touchtone pad tones are not considered to be codes and ciphers;
their use in traditional repeater and other applications is fine.

*** Quoted from "The FCC Rule Book Guide to the FCC Regulations" 9th
*** edition, ARRL
***

The above very clearly spells out that it is illegal to use Codes or
Cyphers over amateur radio with two very specific, narrow, and well
defined exceptions.

Lets keep amateur radio clean of politics, and devoid of anything but
open, clean, honost conversation. Amateur radio should have the content
that children can listen to (if they are interested.) Amateur

radio is intended as "A radiocommunication service for the purpose of
self-training, intercommunication and technical investigation carried
out by amateurs, that is, duly authorized persons interest in radio
technique solely with a personal aim and without pecuniary interest."
[97.3(a)4]

I VERY MUCH support the use of PGP and PGPphone... however, lets keep
it off of amateur radio. Licensed amateurs who are interested in keeping
the amateur service alive and well in America are struggling to keep
it as clean and as pure as it has been over the years. Granted,there
are problems, but encryption would very quickly lead to procecution of
individuals and (more seriously) the removal of spectrum from amateurs
by the FCC and congress for auction to the highest paying bidder.

We NEED PGP, and PGPphone for our internet, e-mail, computer, and
telephone communications to ensure privacy, and I believe that without
an iota of doubt in my mind. I have great respect for Phil Zimmerman,
and all who help promote the values he, his ideas, and his software
promote. His encryption package most certainly has it's place.

I hold privacy in extremely high regard, along with free
speech. However, via amateur radio, there is no expectation of privacy,
and no attempt should be illegally made to obtain it. Improper
use of our precious amateur radio spectrum will lead to it's confiscation.
Spectrum losses would not only punish all amateurs in removing their hobby,
but their hobby, but also all of society who reap the benefits of amateurs
who using these frequencies volunteer their time and skills when the need
arises.

Don't think I am making this up... it has been happening. Take for example
our 220MHz band. A big chunk was taken away for business interests who
were unable to impliment the technology they proposed.
(I think they attempted Double sideband data transmissions
with a suppressed carrier
in a mobile environment ... what were UPS thinking??)
Business interests abandoned the frequencies but the FCC never returned
the allocation to Amateur radio use. This trend could get worse.

As another example, just recently in the massive 2,000 page omnibus
Consolodated Appropriations Act, which congress passsed and the
President has signed (now Public Law 104-208) amateurs will be forced
to leave a large portion of the 2.3GHz band. Yes... we are loosing
frequencies, and without appropriate use of what we do have,
we will loose more.

Become active: write your representatives, support the ARRL (which is our
only real lobbying group), and use our ability to self police our bands
to run off activity which is inappropriate on our bands. Amateurs have
a lot to offer society when we are needed. We need our frequencies to be
available in time of need. Don't let public spectrum be sold off to
business interests.

>Amateur Radio - N1SJQ
>Packet Radio - n1sjq@n1sjq.ampr.org or N1SJQ@KA1OU.FN43FE.NH.USA.NOAM

There are several of them. Run up a copy of LYCOS or whatever and look up
OH2BU, for example. Very nicely done LINUX cluster that will even take spots
from you direct. What is the counter now over 1,400,000 hits the last I
saw of it?

There are also TELNET ports to a bunch of them.

As to why, the reaction time on these is a TON faster than the over the
air versions at 1200 baud....

:)

KAWIN NEWS - Announcing KaWin 6.45

KaWin Home Page: http://www.mutadv.com/kawin/

KaWin 6.45 is ready for download! Corresponding changes to
the help file too. KaWin 6.45's enhancements were suggested
by KaWin users YO3JF and KD1NE. Thanks Ion and Ron!

In-line, keyboard macros - all of the macros supported for
Quick Keys and files are now available as you type.

The HF Mode Switch menu now pops-up for quick mode switching
when you click on the HF on-the-air box in the KaWin Status
Bar.

Users of non-English Windows versions will appreciate the
ability to turn off "slashed zeros".

The CQ Robot now permits calling intervals from one second
to two hours.

Problems copying and saving selected text are fixed.

The KaWin help file has been updated to reflect these
enhancements, but does not yet include the FAQ, "Tips" or
the suggested expansions.

I'm continuing to assemble notes for the addendum to the
KaWin Help file. This will add "Frequently Asked Questions"
(FAQ), and "Tips" topics to the Help file, and your
contributions are needed. Input is solicited from tire-
kickers as well as new and old registered users.

Please send all contributions to: stan@mutadv.com

There is at least one website dx cluster, as well as several that you can telnet to. Just put "dx cluster" into a few search engines and that should keep you busy for a while. It doesn't seem to have much practical use to me either, unless you can find one near your area that you can't connect to by packet.

As an experimental network, there is some routing of parts of network 44
to and from the rest of the internet.

In general, because of access controls, ham radio based links will not
respond to pings nor connection attempts from non-net-44 addresses.

Will the PK-88 work for an X1-J node ?
I have one up the shelf and would like
to put it up as a node if I could. Our
local group has a dead area to the North
West this would add to the coverage.

Thank you
Gary K3SJX

6050. Free Electronics Directory

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-20 00:00:00 UTC
From: Todd Peterson <elab@netins.net>
Message-ID: <3293C92E.1896@netins.net>
Source record: 33550

Greetings!

E-LAB Digital Engineering, Inc. is pleased to make freely available our new Electronics Internet Resource Directory!

This directory is a collection of many internet sites of use to electronics builders, designers, and engineers. It is divided into 40 categories, with each category containing many hot-links to companies and/ or web pages containing information on topics from Compilers to Code Examples to Components Distributors.

The directory is available at http://www.netins.net/showcase/elab
You WILL want to set a bookmark!

We also invite you to check out our products, such as our new line of integrated circuits for embedded design.

Thanks,

Todd Peterson
E-LAB Digital Engineering, Inc.

6051. BPQ/DataEngine - unusual 'freeze-up' problem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-20 00:00:00 UTC
From: Ron Stordahl <ron@digikey.com>
Message-ID: <3293DF74.2DF9@digikey.com>
Source record: 33551

The attached file, BPQCFG.TXT, describes a problem which is seriously effecting the reliability of the Northern Minnesota DX PacketCluster Network. If you have experience with the use of Data Engines with BPQ firmware for remote nodes I would like to hear from you.

Please read the attached file BPQCFG.TXT

Thanks,

Ron N5IN ron@digikey.com

Here is a description of a problem I am experiencing with our Northern Minnesota DX network remote nodes which use Data Engines with BQP firmware:

Some remote nodes are dual band (9600baud-440MHz/1200baud-144MHz) while others are single band (1200baud-144MHz). The problem being experienced occurs identically in both configurations and thus bench testing is being done on a single band unit. The problem is also unrelated to signal strength, the bench test unit experiences the identical problem as does a remote unit.

Now a description of the problem: Any path which includes a BPQ/DE node through which one or more connection is established, will, after a period of time, 'freeze-up' that particular connection and eventually disconnect. At the same time other connections through that same node will continue without difficulty, perhaps only to 'freeze-up' at a later time. For example K0UXQ, a home user, is connected via BPQ/DE node DE8DX to WA0PUJ, a DX PacketCluster. W0PHD is also connected to WA0PUJ via the same route. K0UXQ is listing a DX bulletin of perhaps 10,000 bytes and sometime before the entire bulletin is copied the stream of data just grinds to a halt. After 10 minutes the connection is broken. All this time W0PHD continues to receive normal service from the WA0PUJ DX PacketCluster, although his service may also 'freeze-up', perhaps hours later. In extensive testing I have had up to 2 such BPQ/DE nodes on the bench, setting up a route of K0UXQ to node 1 to node 2 to node 3 to WA0PUJ. Randomly any one of the 3 nodes will be the first to 'freeze-up' for a given user, while other users on the same route proceed normally, although with enough time or traffic every additional user will eventually also 'freeze-up.' All that is required to return the route to usefullness (sort of) is to disconnect and reconnect.

The frequency of the failure which I have described appears related to the volume of traffic moved through the node, although these is no magic amount which can be guaranteed to produce the failure.

I enclose a copy of the BQPCFG file, perhaps an experienced user will see a problem with some parameter.

There is a simple solution. Simply replace the BPQ/DE node with a TNC-2/X1J4 node. Doing so makes the route completely reliable. So why don't I just do this? We must have 10 of these Data Engines, and they were not cheap. If there is a reasonable solution which permits us to continue to use them I would like to hear about it. If this fails we will have to beg the money from our DX users and replace the TNC's.

Is anyone else experiencing the problem which I describe?

Thanks for your help

Hello ALL

Some Amateurs that have tried to download the NEW version of Winpack V6.10 from my web page have experienced problems trying to get the 1.33MB file down.

To help get it down and to relieve the frustration, I have broken Winpack down into 4 parts to give a better chance of getting each section.

http://www.acay.com.au/~vk2yx

Cheers..Peter

6054. Telemetry & Coding

Hello,
I am new to the world of packet and I was wondering if I could get some information? First, when a TNC is placed in command mode, and the mall command is initiated, as traffic is observed there is usually <UA ..> and other symbols at the end of the line. What do these symbols mean?
Secondly, I intend to use packet to capture telemetry data. I would like to write my own terminal program to log the incoming data. Has anyone done this before? If so, is it just a matter of connecting with the correct callsign, and then starting the data flow. Any help would be greatly appreciated.

Joern.

Eddie,

You said that you want split-screen, so I guess Win95's HyperTerminal is out. Another suggestion is to use a program called PacketPet for Windows. This is not a native Win95 program (it's Win31), but it runs very well under Win95. It has a TON of features, but you don't have to use them all. It works quite well with my MFJ 1270 TN. It even "speaks" the call letters of the station to which you are connected! I have had ZERO luck finding this program on the 'net, but it is on AOL. If you want it, check out AOL or I can put it in my FTP site temporarily for you to get or I could e-mail it to you. It's big, about 1.2mb, but I think it is one of the best TNC programs for Windows out there.

> why the hard way.

My AFSK KAM+ works great on my 450 and my 690. Always has.

A friend's radios (he operates a number on HF,
WA8BXN@WA8BXN.#NEOH.OH.USA.NA) work fine on AFSK, too.

I made some comparisons of the rig's FSK performance to its AFSK
performance and found that AFSK was preferred. This is not
theoretical bs. I drove 300 miles and connected up to home a couple
of dozen times over a couple of weeks. I wish I could remember
specific reasons I chose AFSK over FSK but I would encourage others
to perform the same tests.

Sounds to me like a problem with AEA.

(Or ... are you talking about the 2.1 kHz frequency difference? If you
wanted to connect up to NO8M on 14074 mark with a AFSK KAM+
you would set your dial to 14076.1. You would then adjust the IF
Shift to center the KAM's LED meter to the white noise on the
frequency.)

>that only a very few 44.x.x.x hosts are directly reachable from the
>Internet. The owner of 44.x.x.x., Brian Kantor, (located at, surprise,
>UCSD), could probably tell us for sure.

44.0.0.1 alias ampr.org alias mirrorshades.ucsd.edu uses a technique called "IP encap", "IP tunneling" or "IPIP" to carry the IP frames further on to the destination. It encapsulates the source IP frame into athother IP frame directed to a router who knows about the original target at the original's target network. The routing table at mirrorshades tells the system which destination address the outher IP header gets.

This approach has the following positive aspects:
- Every subnet in the 44.0.0.0 network has not to be announced to the internet backbone routers.
- Easyness in setup

There are two negative aspects I can think of:
- Speed: Even an IP frame from one host in germany to another has to go via ucsd.edu . That way it has to cross the atlantic two times.
- Traffic load at ucsd.edu

The only question that remains is:
- How can I add my sub network to the routing list at ampr.org ? Is there some kind of mail robot like for updating the domain database or does Brian add entries on the list manually and only on request?

Anyway, take a look at this:

$ traceroute ka9q.ampr.org
traceroute to ka9q.ampr.org (129.46.90.35), 30 hops max, 40 byte packets
1 ostcisco.hrz.uni-bielefeld.de (129.70.35.1) 1.424 ms 1.199 ms 1.19 ms
2 gigacisco.hrz.uni-bielefeld.de (129.70.2.9) 1.976 ms 1.019 ms 1.003 ms
3 Uni-Bielefeld1.WiN-IP.DFN.DE (188.1.4.141) 2.784 ms 1.838 ms 1.774 ms
4 ZR-Hannover1.WiN-IP.DFN.DE (188.1.4.137) 5.732 ms 3.322 ms 3.34 ms
5 ipgate1.WiN-IP.DFN.DE (188.1.144.62) 10.419 ms 9.758 ms 9.636 ms
6 border3-serial3-1.WestOrange.mci.net (204.70.67.45) 164.115 ms 163.742 ms 180.208 ms
7 core1-fddi-0.WestOrange.mci.net (204.70.64.17) 178.678 ms * 176.694 ms
8 sprint-nap.WestOrange.mci.net (204.70.1.210) 258.174 ms * 496.246 ms
9 * sprint-nap.WestOrange.mci.net (204.70.1.210) 330.3 ms 204.034 ms
10 cerfnet.sprintnap.net (192.157.69.5) 172.67 ms 161.204 ms *
11 san-atm-ds3.cerf.net (134.24.17.100) 236.377 ms * 222.959 ms
12 qualcomm-sdsc-ds3.cerf.net (134.24.47.200) 231.275 ms * 230.648 ms
13 * krypton-e2.qualcomm.com (192.35.156.2) 234.045 ms 226.821 ms
14 * ascend-max.qualcomm.com (129.46.54.31) 242.766 ms *
15 * * karnp50.qualcomm.com (129.46.90.33) 258.305 ms
16 unix.ka9q.ampr.org (129.46.90.35) 266.721 ms 251.253 ms 331.818 ms

Well, what did you expect? :-)
Obviously not every IP frame to hosts within the amprnet go via mirrorshades,
obviously some (or should I say "some subnets"?) are announced individually.

Hi, Netters:

I recentely bought a multimedia PC and I am curious about
the floowing question.

usually shortwave broadcasting are very noisy, especially
listening to far or weak station. Are there any hardware or software
that take the output from shortwave radio (through audio output) and
perform "noise filtering" and "signal enhancing" process on PC and
send to PC's speaker? in that way, the audio quality can be improved without improving
antena system. Any pointer is appreciated.

Larry Chen

I didn't know they'd come out with that, Dale. But *yeow* $550?
That's pretty steep for 3 watts. That's the kind of money I paid
for my classy 20 watt SSB Electronics transverter.

They say they are still going to honor their warranties, but I don't know where that leaves folks like you who are waiting on firmware. Messages regarding this posted in rec.radio.amateur.misc suggest that they are / have sold off their product lines. Perhaps another company will pick up the DSP-232 and carry the ball forward. Time will tell I guess.

6071. Newbie Q: radio & modem?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-21 00:00:00 UTC
From: Ken Harris <kjh@shoreline-studios.com>
Message-ID: <329531A1.59E2@shoreline-studios.com>
Source record: 33471

What's a good beginner radio and modem? I'd like to
get into satellite packet at some point.

I like the idea of using a PC as a TNC (with just a
UART in hardware). The Baycom modems seem cool.

To: "John Seney" <john@wd1v.mv.com>

Just got off the phone with Mike Lamb. It is true. AEA is history and he
only has hopes of selling the product line if possible. Also a side notefor
the Mac users of the DSP-2232, If anyone would like to get the MacRatt III
software fixed for the DSP-2232, the author needs a box to test with, and
debug the code. I have his email address, and I am sure we could work
something out. Message me if you could part with some hardware for a few
months. Bruce AL7AQ

6085. Save 80% On Your Grocery Bills!!!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-22 00:00:00 UTC
From: save@grocery.com
Message-ID: <574d05$oc@ns1.autonet.net>
Source record: 33485
Cross-posted to: rec.photo.technique.nature,rec.photo.technique.people,rec.ponds,rec.puzzles,rec.puzzles.crosswords,rec.pyrotechnics,rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

THIS is Your Problem!!!
~~~~~~~~~~~~~~~~~

The average American family spends approximately $400 per month on
food and other grocery store items. That monthly expense is increasing
constantly, and EVERYONE is always looking for ways to cut those costs.

Now the way that most consumers are saving money at the grocery store is
by using " cash off " coupons. In fact recent national surveys report that
90% of ALL American households use grocery coupons weekly!

But .... until now the problem has been that " coupons clipping " is a
hit-or-miss proposition at best. It generally means a time consuming,
tedious job of sorting through perhaps dozens of flyers, circulars, and
magazines, and cutting out only those few coupons that fit your needs.

National statistics actually tells us that although the typical Sunday paper
contains 100 or more "cash off " coupons , the average person manages to
clip only 3 to 6 coupons for products they really want and use.

And THIS is Our Solution !!!
~~~~~~~~~~~~~~~~~~~~

"Why can't someone invent some kind of a 'system' so a consumer could
ORDER JUST THE COUPONS THEY REALLY WANT AND USE!?"

Well, now someone has!!!

You begin by subscribing to our unique "Coupons-By-Choice" service. For
a subscription fee of just $20 per month you will receive one of our
exclusive "Coupons-By-Choice" booklets. Your monthly Booklet contains
certificates which may be redeemed for up to $100 worth of cash off
grocery store coupons that YOU CHOOSE from our list of HUNDRED
OF NATIONAL , NAME-BRAND PRODUCTS!

HERE IS HOW IT WORKS....
~~~~~~~~~~~~~~~~~~~~~~
Each "Coupons-By-Choice" Booklet contains 10 "coupon order forms."
EACH order form can be redeemed for $10 worth of PERSONALLY
SELECTED cash-off coupons. You actually CHOOSE exactly what
coupons you want from our master list which is printed in each Booklet.
You then mail the completed order form and a small handling charge to
our redemption center. In just a few weeks you will receive $10 worth of
cash off coupons that YOU chose! PLUS ... you will receive additional
coupons of your choice to reimburse you for your handling charge and
~~~~~~~~~~~~~~~~~~~~~~

your postage!

And remember that these are MANUFACTURERS' coupons for
NATIONAL, NAME-BRAND PRODUCTS, and are valid at any store that
CURRENTLY accept coupons!

So the real beauty of our system is that, as a subscriber to our "Coupons-By-Choice" service, you do not have to change your buying habits at all to receive substantial savings!!

* You do NOT have to shop at certain stores! You continue to
shop where you ALWAYS do!
* You do NOT have to purchase "special" products from special
"dealers!" You continue to buy the SAME products and brands

you do every day!

Where else can you receive a return of $100 to $200 ... on a monthly investment of only $20 !!??

THINK ABOUT IT!....

READY TO START SAVING??
~~~~~~~~~~~~~~~~~~~~~~
With regard to this particular ad, there is only one way you can get the necessary APPLICATION forms as well as more information about our company and this AMAZING opportunity:

Call fax-on-demand 512-404-1275 (must call from a your fax machine)

Remember to put your sponsor's ID number in all application forms, otherwise they will not be processed.

Build, ha! Many of us "appliance operators" are either too busy to build
or don't know one end of a soldering iron from the other.

Besides, OEM equipment always looks so much nicer.

Radio Randy.

From: Ken Morris <kmorris@powerup.com.au>
Message-ID: <3297B63A.4E9B@powerup.com.au>
Source record: 33402

As with ETHERAX25 program, this allows to trick DOS TCP/IP programs
to believe it is talking to LAN card, so that Internet programs
can be used on amateur radio. Has anyone seen a program to allow
the same for OS/2 inbuilt TCP/IP to talk on ax.25 network ?

So in short, I am looking for AX.25 driver for OS/2. OS/2 has been
very good (Merlin Version 4 even better), so would like to use
more of it's inbuilt features.

>What's a good beginner radio and modem? I'd like to
>get into satellite packet at some point.

If you want to get into satellite packet, you don't want a beginner radio or modem.

> I like the idea of using a PC as a TNC (with just a
>UART in hardware). The Baycom modems seem cool.

Baycom doesn't use a hardware UART. It bit bangs, implementing a USART in software (note USART, not UART, packet uses *synchronous* HDLC, and a UART can only handle *asynchronous* data). The only added hardware used in the Baycom system is a simple modem chip (which is obsolete and out of production, though still available in limited quantities from some distributors).

To do satellite packet, you need all-mode radios for at least 2m and 70cm (and preferably for 23cm and 13cm too considering the imminent launch of P3D). And you need 1200 baud PSK and 9600 baud FSK modems (and something in the 38.4 to 256 kb range for P3D's advanced modes, stay tuned for more info on that). The simple Baycom system won't work for any of that. The ideal solution is a DSP modem (but with AEA now defunct, the range of choices for viable DSP modems has become very limited at the moment).

The *minimum* system for satellite packet is a duplex dual bander and a 9600 baud G3RUH style FSK packet modem coupled to a TNC or a synchronous interface like the Ottawa PI2 card. The problem is, none of the current crop of dual banders is *actually* 9600 baud ready, advertising claims not withstanding. So the reality is that you still need the all-mode radio, IE an IC821H or FT736R, to do satellite packet properly.

Note, if you're willing (and skilled enough), you can cobble a workable 9600 baud satellite station up from commercial surplus radios such as a high band Mastr II and UHF Micor, or the like, for much less money than an all-mode amateur rig. This is cut and paste, however, and probably not something for a beginner to tackle.

If you just want to get your feet wet in packet, and realize you'll have to get something else when you move on to satellite packet, then a Baycom and an Alinco DR-1200 2m packet rig, or virtually any other 2m rig, will do. If you want to start out

on 9600 baud, the little 70cm TEKK radio is cheap and effective.
You'll need to buy a real modem and digital interface, however,
the Baycom won't hack 9600 baud.

(Note to avoid confusion, the Baycom folks have a 9600 baud
modem too, but that is *very* different from their regular
"dongle" product.)

>"... contribute to the advancement of the radio art."
>That's Part 97.1(b), but only one of the five purposes of the Amateur
>Radio Service as defined in Part 97.1.

Correct, but purposes (c) and (d) also demand technical leadership
to sharpen our skills with SOTA technique. And the SOTA is definitely
in the digital arena.

>None of the puposes described here requires that the Amateur Radio
>Service prove it's worth by defining the edge of technology.

Well, I'd contend 97.1(b) does, and 97.1(d) certainly insists that
we be au currant if we are to form a pool of trained technicians and
electronics experts. (There's little demand for experts in obsolete
technique.) Note that the amateur service is intended to serve as a
reserve job training program for military and industrial needs. That's
fullfilled by goals (c) and (d).

>On the contrary,
>we, without pecuniary interest, cannot be expected to produce new
>technology. It is in spite of that handicap, that we sometimes do.

I would suggest that it is *because* of that *advantage* that we
sometimes do. We aren't restricted by demand for quarterly bottom
line results, we aren't pressured by marketing to get half baked
products out the door, and we are free to pursue avenues of research
which may not pay off for 10 to 20 years (if then). Those operating
"for profit" don't take that long view. They only pay engineers to
develop the "sure things" on time and on budget, and sure things are
rarely ever truly new or innovative because the new and the innovative
requires exploring uncharted waters. Amateurs enjoy a freedom to
follow wherever their curiosity and interest leads them precisely
because their family's livelyhood doesn't depend on "sure thing"
success in their explorations.

It is exactly that sort of freedom which has brought us most technical
innovation. That sort of freedom is seldom seen in industry today.
Bell Labs used to offer it, Sarnoff Labs used to offer it, but no

more. Only the government's national labs, and a very few universities, are allowing that sort of free range of inquiry today, and most of that is driven by a cutthroat grantsmanship and a publish or perish syndrome which isn't conducive to good results. Amateurs still have that freedom so essential to true innovation.

Most of the really breakthrough ideas are "table top science". The huge government and industrial labs can tackle the heavy iron projects which establish another decimal point, but it is the quiet table top science which most often brings the totally unexpected breakthroughs.

In communications today, the table top is a computer keyboard and screen since many of the most promising communications advances are almost wholly software driven. Software is the ultimate cottage endeavor. It doesn't require lots of money, just a computer and an inquiring mind with the time and peace to contemplate new approaches. That time and freedom from pressure for bottom line results has become almost the exclusive province of amateurs.

Amateurs rarely achieve commercial success with their innovations, and that's as it should be. Amateur radio is not intended to be a "for profit" track of patents and commercial production and marketing. But many of the ideas first held by amateurs, and freely distributed by them to anyone who wishes to use them, *do* find their way into commerical products once amateurs have turned them from uncharted waters to the "sure things" a commercial R&D manager will let his engineers tackle.

As an immodest example, I'd suggest you look back through the archives a few years to the posts where I first proposed using TIL agents for distributed network computing, and then compare that to something called an applet in a product called Java. The web didn't even exist back when I came up with those ideas, but the limited resources of amateur radio computer networks led me to the idea of reducing network bandwidth consumption by distributing autonomous processes to off-load the network from having to pass every bit produced by an application's computations to the end user. Other amateurs may not have embraced that idea, but the web certainly has.

Hams are a funny lot. It has been announced here several times that AEA is selling their product lines. What do you guys think they are selling? I am sure it is the source code to their TNCs as well as the PCB layouts and the sheet metal drawings.

I have had my DSP-232 for about a year now. AEA has been working on the code for that amount of time plus their development time. I am sure the value of the product is the engineering time that went into the writing the code. Do you expect them to give it away?

I got upgrade EPROMs for my DSP in the mail two days ago. They are working for me.

Bill

Bob was writing about the DSP-232. AEA's PK-12 also had a serious firmware bug that would not let it make connects with 2 addresses in the destination, which effectively made it useless for connecting via a ROSE switch. They did produce a fix for it but I don't know how well it was distributed. What really bothered me about that was that the PK-12 was an 'entry-level' TNC and if it didn't work, a new user was likely to believe that he or she was doing something wrong, rather than the code in the TNC being farbled up. And AEA's tech support was *not* helpful with this problem. It took escalation to a VP of the company with *my* troubleshooting results proving the problem to get it fixed.

maintain,
Hopkins

This will not work in all cases; it is relying on a side effect of ping implementations and assuming a rather more restrictive choice of software than simply Windows.

Versions of nslookup do exist for Windows. NT 4, has one included.

The address you quote is not in the amateur radio network (44.0.0.0/8);
it was in a "normal" class C network. Domain names (ampr.net) are much
more flexible than IP addresses and reflect an administrative, not a
physical network, structure. Your example doesn't disprove the
hypothesis that all of 44.0.0.0/8 is routed through mirrorshades - I
would thing a single interconnect point would be the most likely case.

>Distribution: all

Used on USENET this is likely to have either no effect, or restrict
distribution in arbitrary ways. It is not one of the few more or less
universally recognized ones.

I'm interested in replacing my MFJ-1278B Controller, which seems to
die every 10 to 12 months. I operate a little Packet, Pactor, Baudot
RTTY and AMTOR. Occasionally I'll SWL some Utility Stations or look
for SlowScan and FAX transmissions. The MFJ is not particularly great
on any of these modes and I'd particularly like something that was
more effective on HF in the presence of QRM and at low signal levels.
Has anyone had experience with a number of the current models of
Multi-mode controllers? Which is best for the type of use I described?
Thanks,
Ray - W9BN

I am amused!

Well, OK, I'm really not amused...

Given that AEA is in the process of selling off their residual production to go out of business, I am just amazed at this impressive good deal R&L Electronics is offering... NOT!!

It sure looks to me that they're all too willing to screw a few customers to solve their stock problems...

Wouldn't it have been a little more fair of you to caveat your ad here with the note that they who buy AEA products now do so with little to no possibility of product support, since AEA is about to go belly up? Oh well, bidness is bidness!!!

As always: caveat emptor. I'll remember this ad next time I'm shopping for gear...

I can recommend Lyle Johnson WA7GXD's speech made at the 1996 ARRL and TAPR Digital Communications Conference. It is transcribed at the TAPR Web Site (http://www.tapr.org, look for Digital Conference). In his speech, Lyle discusses the exact points that Dick raises. Of the original purposes for the creation of the Amateur Radio Service, only advancement of the radio art is likely to remain relevant in the next few years.

Read it for yourself (or hear it for yourself if you're RealAudio capable.)

Disclaimer- I transcribed Lyle's speech.

6115. Re: Digital & Analog

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-24 00:00:00 UTC
From: rwigg@aol.com
Message-ID: <19961124040800.XAA10080@ladder01.news.aol.com>
Source record: 33415

When you think of digital information think of a radar "blip" or sonar "ping" or morse code "dit" or "dah". Where analog signals are more like waves. Since all forms of propagation get worn down (attenuated) going thru the atmosphere, the analog "waves" can wear down to almost nothing and get lost in the noise. But digital will also wear down it is easier for the receiver to discriminate between the signal and the background noise.
Also, digital technologies are RELATIVELY new and not every one has a computer or digital device to receive the signal. That's one of the reasons why one of sales pitches for digital phones as being more secure.
DISCLAIMER: I'm not an expert, My radar tech. days are 2 decades past. But I thought this is a slightly more understandable explaination than an earlier one.

Hello, Folks:

I now have Packet Bulletin Export Files available on my Home Page.

The files are split by distribution group. I now have the following available: ALLUSA, WW, EU, CANADA, ARRL, AMSAT, and NASA, and many others. Others may be added as needed.

Files will be posted daily and should be online after about Noon Central Time.

Just point your Netscape 3.0 or MS Inetrnet Explorer 3.0 browser at:

http://www.trucom.com/ppages/marty

and go to the Amateur Radio area. The rest should be clear to all.

NOTE: New export files by distribution are being added almost daily! Many thanks to all who are sending me their BBS exprts via attached E-Mail for inclusion!

I can always use more folks sending their export files. Please consider sending me yours via attached E-Mail! The more I get, the more that will be available for all.

Take Care & 73

As a packet sysop, it's usually my job to encourage people to get into packet so that's what I'll do. Regardless of the fact that information is available at a much higher quantity and speed via the internet, it really has nothing to do with amateur radio, being a primarily wired environment. This would change once everyone had a personal satellite uplink but, that's a few years off yet.

Amateur radio is a world of experimentation, or it should be, and as such, there are those who are still working on increasing the efficiency of all the modes therein, packet being just one of them. There are now 56KBaud packet links in many places and 9600 baud is becoming widespread. True, the packet world does utilize the internet for traffic forwarding and interconnection between radio LANs but this is intended to increase efficiency also.

Personally, I find it interesting that I can take a HT, a battery operated TNC and a battery operated laptop computer and operated packet pretty well anywhere I can get into a node. Totally wireless. I have done a bit of travelling and bring my portable gear whenever I can and keep up with things.

Currently, we have come in to the satellite age with the use of PACSats and orbiting mailboxes, such as KO-23 and the MIR machine. In fact, since August 1996, we have a fulltime dedicated packet satellite link between Newfoundland, Nova Scotia and British Columbia through the IPARN system, piggy backed on a geostationary communications satellite.

Packet is growing but I guess too many people are getting caught up in the hype and glamour of the internet. They are all tools or hobbies. I find packet interesting and would like to see it continue to grow and the only way to ensure that is for people like yourself to take the plunge and determine if it's something you want to be a part of.

I also am involved with some of the other digital modes but that's another topic HIHI.

Yep, I was working on it, but I stopped development some month ago because there
seemed to be no real interest in it.
However, it already works but is a little unstable and wastes a lot of CPU power.
It is called "WAMPlus" (derived from WAMPES bye DK5SG/KA9Q) and was ported from
the linux version.
It is easy-to-use and provides a lot of advanced features like AX25 callsign filter,
KISS multiport support, flexnet support, netrom support, "autorouter" and so on.

I'd continue development on it if there was more interest in it.

Well, It just goes to show that there are many aspects of ham radio to whet everybodies interest.
I, for example, could care less about talking on 2 meters - especially through a repeater - a telephone or cellular phone is much better without all the qrm.

Just the fact that we are able to connect a radio up to a computer and chat with other technically inclined hams is pretty exciting to me. And I am not confined to 1200 baud, I can connect to the internet gateway at 9600 baud and chat with hams all over the world in the ww conference. I realize this may not be available in every city, but if it isn't, here is an opportunity for an enterprising individual to do something really different.

Additionally, depending on which TNC you have, you can operate on other modes besides packet. There is AMTOR, PACTOR, RTTY, WEFAX, SSTV, etc.

Try it - you'll like it!

73, Gene WA4WBI

Hello All,
I need a little advice. I am looking for a program to use to download
weather fax pictures off satellites. I am using the DSP-2232 tnc.
Whitch program is the best ? I have a demo verison of AEA wefax but,
since AEA is out of business dont think I can get it. Any info would
be helpfull.
Thanks and 73 Fred KB4QZH

Greetings and hello, I just got interested in weather sat. reception. Downloaded JVFax6.10, built the 741 interface. Now I need more info. How about a list of freqs for NOAA & Meteor. Going to try to use 2004 or 2006 Rat Shack scanner. Have other radios that can be modified if they don't work right.

It has been announced that AEA is *attempting* to sell their product
lines. If they manage to find buyers for their product lines, well
and good, we can get support from the new owners of the product line.
But (as seems somewhat likely), if they can't find a buyer for the
product line, it would be a nice gesture for them to make the source
available to their long suffering customers so we can attempt to
fix the problems ourselves. (Heck, I'd even *pay* a reasonable amount
for good commented source for some of their products.)

I'd like to see all amateur manufacturers make it a policy to release
source (under a non-commercial use copyright) for any product that they
no longer support (for whatever reason). As more and more amateur products
become dependent on microprocessor code, it is going to become harder to
keep them going after the manufacturer either abandons the product or the
manufacturer becomes defunct. I rather doubt that there are many trade
secret algorithms coded into amateur products which would be of any
commercial value after the product line is orphaned, so I don't see this
as harmful to the manufacturers. I see it as a matter of good will to the
amateur community.

----- begin snip -----

Hi there!
I am new at this hobby and trying to set up packet gear. Now I got the
2M going in voice. I don't find anything intersting or exciting on
the idea of connecting 1200 baud on packet, say compared to Internet.
Please someone tell me why I should have a packet when things like
internet or BBS is going on 28.8K baud.

Paul Yim,
paulyim@cnct.com

----- end snip -----

If your criteria is "Which one works faster?", then don't bother
with packet. Also, don't bother with ham radio - the telephone
works faster (and better).

This is a hobby. We play with our radios sending signals out
through the air -- not along telephone lines. IT'S A HOBBY!

Jack DEFINITION: "Ham Operator" - A lonely,
VE3EED/W7 pathetic, wretch sitting in a corner
in somewhere - tuning around on his radio -
Mesa desperately trying to be important.

Tell us what *is* the main problem.

>I would't use transverters, though. It is much easier and cleaner to
>generate 1.2 GHz signals directly than to mix them up from 2M.
>(not to mention 10M)

I'm not sure that this is true. Since there are off the shelf
transverters which can do it, I don't think it is easier to build
up a PLL radio for 23 cm than it is to hook up a transverter. And
we've used hetrodyne technique for many years, are comfortable with
it, and have learned how to do it well. I'm not at all sure that
the PLL rig will be cleaner (in fact I'd almost be willing to bet
it would have higher phase noise).

>In Europe, the Interlink-TRX designs by DF9IC are most popular. The

Full duplex operation allows effective employment of AFC, and that
makes things much easier.

>
>Of course a DSY modem will go faster, but on 23cm the total effort will
>be quite high because of the dual conversion that is required.

I don't think so. As Dale informed us, Down East now has an off the shelf transverter which will do it. So no effort is involved (just some scorching of the plastic in the wallet). I've also noted before that there are inexpensive ways to cascade to 1.2 GHz. It would seem your TRX radios are dual conversion too, first IF at 59 MHz you said.

>The S53MV 1.2 Mbit/s design looks nice, but there is no room in the
>23cm bandplan to allow the setup of a well-meshed network using this
>kind of bandwidth. For some fast local link it could be used, of course.

There is room in our bandplan. We have someone here building several sets for use as part of a thesis project. We're watching that with interest. I'm pretty sure that the wide bandwidth will make frequency stability issues much less of a factor than with the narrowband stuff. I'm not as sure about how robust it will be in the face of the high RF environments with which we have to deal. We'll see.

BTW, Dale is experimenting with FEC implemented in hardware on board the new WA4DSY modem. That's not quite ready for release (and may never be, it *is* experimental, but you can download the current image from his website, www.wa4dsy.radio.org). He's already seen a 3 db improvement against gaussian noise, and a much larger improvement against some forms of impulse noise (impulses 40 db stronger than the received modem signals don't increase observed error rates) in over the air tests.

We had power line arcing near one of our high speed repeater sites that was just killing throughput, addition of FEC in the end point modems has reduced retries to nearly nil, IE *no* mods were done to the bit repeater site being slammed, just to the end user stations. Stations using this ECC mode aren't compatible with stations using the ordinary 56 kb mode, but Dale has included a way to manually switch the ECC modem back to ordinary 56 kb operation to deal with that for now.

I've been of the opinion that FEC should be done on the PC rather than in the modem (Karn's approach), but Dale has some good reasons for putting it in the modem instead. The only downside, other than the ECC overhead, is a longer lockup time, Txd has to be moved up to 16 mS.

hi!
We are a radio club at the university, and we have a PC
running Linux and AX.25, with a BBS, but we also want to
use the same AX.25 port for calling out, with the members'
personal call signs, without taking the BBS of the air,
is this possible with the normal "call" program?

Hi, Dale
DH> Down East sells a model 1296-28 transverter. It has a 10 meter
DH> IF. It puts out 3 watts at 1296 mhz and is $550. This will
DH> interface to the WA4DSY 56k modem directly.

This sounds *very* interresting.
Have you got an estimate what the total cost would be for such an
installation? We have a USCC4 card, and would need a WA4DSY modem and
this transverter ($550). Would the modem interface to a common TNC?
What kind of antenna should be used? Can we make one ourself?

Beware! There are several software problems
in the DSP-232. The software to fix them was
in beta and scheduled for shipment around
Thanksgiving. I know, I bought one about a
month ago and was looking forward to receiving
the fix. Damn! They'll be giving these things
away before the end of the year.

Bill,

I don't give a damn how much they have invested in fixing the problems.
I have already paid for a flawless product and I sure as hell don't like
the idea of paying for it twice. So what's wrong with them posting the
code so those of us who got burnt can get some relief?

Rod Hart

Hi Gary,

Well your idea has merit, I'll admit that.

I did get final release EPROMs from AEA. They sent them by mail last week.
They are working fine.

Bill

Codes and ciphers may be used to facilitate communication but not to
obscure it. PGP signatures, for instance, are legal by my reading,
since they provide only authentication for a plaintext message.

Any encryption scheme used to generate a signature, PGP included,
would provide the security needed for satellite operations, without
even having to provide a special rule.

Note that you happened to pick an ampr.org host which is _not_ on the
44.0.0.0 net. Rather, this would appear to be one of Phil Karn's
machines at Qualcomm, where I believe he currently works. I also
believe that Qualcomm is in San Diego and is geographically and
topologically close to UCSD where the 44 net is announced.

Jim,
On my MFJ TNC I have a command TXDELAY that is used sequence the PTT and the transmission of characters. There also
is a command AXDELAY that allows for repeater time delays. I do not know if the pk88 has those commands, but if it does you should
adjust those(fiddle) until you get it right!

Paul: There's lots of things you can do with 1200 Baud Packet. If you are into or want to get into Traffic Handling, Packet is a great vehicle for that. If you are interested in Space and Satellites, you can connect to the Russian Space Station MIR and the U.S. Space Shuttle. You can also download telemtry from the DOVE (DO-17) satellite and others. You can get involved with the new Automatic Position Reporting System (APRS) which can be used for things like Spacecraft Tracking or Public Event Tracking, Bunny Hunting, even Disaster Comms and Jammer Hunting. Packet, like CW, Phone, RTTY etc is just a mode that you can use to communicate...it's up to your imagination what you can do with it...

>did not include extra functionality. AEA did not reply, so we just
>continued to distribute it...)

Rob, I can understand your frustration and motivation, but what you
and your friend did is software piracy plain and simple. You can't
redistribute copyrighted software without permission, no matter what
the provocation. It is still theft.

Under the Magnason Act, you could have sued AEA for failure to deliver
a product as represented, and thus gotten a refund of the purchase price
of the PK-232 if they wouldn't fix it to meet specifications for free.
But that's the extent of the remedy available to you under law.

(A good lawyer might turn that into a class action, and might require
AEA to refund the purchase price of every PK-232 ever sold with the
defective code if they refused to release a fix. That would have almost
certainly bankrupted them, and properly too, if they still refused to
release the code.)

You could also have spread the story of their defective product and their
unresponsive behavior to the four winds without fear of commercial libel
if you had proof of your claim. That too might have driven them into
bankruptcy (bad publicity from disgruntled customers can do that sometimes).
And they would deserve it too, but that still doesn't authorize you to steal
from them.

In other words, there are legal, moral, and ethical ways to make them pay,
but theft is never one of them. The code belongs to them. If they choose to
take actions in regard to it which result in damage to their company, that's

their perogative. Corporations are permitted to commit suicide (and AEA seems to have done so), but we aren't allowed to murder them by criminal means.

Gary

6146. PaKet 6.1 ???

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-25 00:00:00 UTC
From: macino@ibm.net
Message-ID: <57d239$2jt2$1@news-s01.ny.us.ibm.net>
Source record: 33354

Is anybody else using PaKet 6.1? I haven't seen any updates lately. I use it in a WIN-OS2 session with OS/2 and it's pretty slick. It is spinning away in it's own session as I'm on the 'net' and connected to another communications program concurrently. Anyway, if there is any new version or news, I'd like to hear about it.

Thanks - Jim WD9AHF

6147. 24 GHz and up

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-25 00:00:00 UTC
From: v.coletti@iol.it
Message-ID: <57d2cm$3td@mikasa.iol.it>
Source record: 33355

I need informations on components available for transmission on higher microwaves bands, such as 24 GHz and 48 GHz.
What would you use to do EME on such bands ?
I think the interesting point is that with a 4 feet dish at 24 GHz you get a 0.5 degrees beam (and at 48 you need only 2 feet!).
Am I right with these calculations ?

I bet main problem here will be to have enough power for a moon reflection at those very high frequencies.

Any suggestions ?

Source record: 33358

Hello All,

I recently sent a PK-232 and a PK-232MBX to AEA for repair. They came back with a sticker saying, "out of business." We've all since heard the scoop on the situation. However, this doesn't get my TNC's any closer to repair. Is there anyone out there willing to take on the repair of these units? Mr. Moore, at AEA, told me that they are looking for someone to sub-out the service and repair function and to call back in two weeks. That was a week ago. I'd like to get this equipment in the repair cycle somewhere asap.

What you need to do is figure out some way to use an ATV transceiver on
900 MHz or higher. Color video signals have a bandwidth of a few MHz.
I think a Houston ATV group did a 1.2 gig FM ATV transceiver. There are
also wireless VCR rabbits on 900 and another similar device that works
on 2.4 gig.

Any ideas for a modem with output that looks like baseband video?

And I too just now received an update in the mail. EPROM, not EEPROM. Parts are labeled "AEA V1.0 L31". Level 31? Instructions dated 10/24/96 say "This upgrade enhances your DSP-232;s ability to function in Amtor, Pactor, 9600 bps Packet and 9600 pbs KISS mode."

Just thinking, if AEA can't find a buyer for their intellectual property, it sure would be nice if they'd post the source code to the DSP-232. One of the reasons I purchased a DSP-232 was that it has a very powerfull CPU (MC68340) that can be programmed with free tools (gcc and gdb), and AEA's advertising copy showed a picture of their PCB including the jack for connecting Motorola's Background Debugging Mode. Alas, haven't had time to play with these toys.

Gary,

I never buy anything unless I think it is flawless and meets
my requirements. Hopefully we have not given up on the quest
for a quality product or a dollar of value for a dollar spent.

Rod

Well I guess I should apologize. I received my new firmware
today. The package was postmarked 12/21 and the software had
a date of 12/6. I installed it and noticed the signal analysis
still seem to have a problem. I'll take what I have (many new
modems) and put up with the minor things. Whew, I thought I
was screwed. Thanks AEA!!!!!! Hopefully they will not go the
way of Lafayette, Heathkit, and the real Radio Shack.

While it is illegal to encrypt anything over the Ham band. It's not
illegal to digitize your voice. example use Internet Phone over the
net. Now the downside. This can at present be only done for experments
and in the expermental portion of the bands. Seems this is the
actually way radio should go but we must provide an easy way for the
FCC to listen in to each conversation before we can do it full time.

Can't really answer #1 because I have never seen mods for 9600 for a ht.

But for #2, if you want to get onto 9600 packet on 440 mhz, check out the
Tekk data radios. They run at about 2w-2.5w and about the size of credit
card. Normally the run at about $150 for xtals and shipping and can only
be special ordered thru a Tekk distributer called Metro North Communications
in Kansas City, Mo....number is 816-452-1900

I did a traceroute to "myself" w5vzb.ampr.org, and it got to the right
gateway (Albuquerque)...I've been on packet but not lately, and never
with tcp/ip, but our state address coordinator did assign me an ip #
and if I were to reach a tcp/ip-capable node (probably over 100
miles away) I'd be all set.

Paul

My answer is how and why:

I operate a Macintosh TCP/IP station. Packet actually
sparked my interest in Amateur radio. In the process of
working with packet I developed a much deeper understanding how
the Internet works, an understanding that goes beyond the keyboard.
The majority of people have no idea of what is really going on
out in "cyberspace". The interaction begins and ends at the keyboard
and the monitor with no thought to the communications network behind
the scenes. I think it is nothing short of a man-made technological
wonder. . .

Source record: 33444

Hello, all -

Does anyone know of a "conference" application for BPQCODE? I've looked at the usual sites (ucsd.edu:/hamradio/packet and tapr.org:/tapr/software_lib) but found nothing. Not interested in Packet-Cluster or similar - looking for freeware ;).

We may have a need here for something like this as we work to upgrade the local packet network. I'll write something if I have to but don't want to re-invent any wheels. If I do have to write it, I'll upload it as freeware.

Thanks for any pointers, information, etc. - 73

Three responses to my posting follow:

On Sat, 23 Nov 1996 Steve Stroh <strohs@halcyon.com> wrote:

>I can recommend Lyle Johnson WA7GXD's speech made at the 1996 ARRL
and
>TAPR Digital Communications Conference. It is transcribed at the
TAPR Web
>Site (http://www.tapr.org, look for Digital Conference). In his
speech,
>Lyle discusses the exact points that Dick raises. Of the original
>purposes for the creation of the Amateur Radio Service, only
advancement
>of the radio art is likely to remain relevant in the next few years.

Thanks, Steve, for the tip. I read it and thoroughly enjoyed it.
Lyle, has an interesting point when he talks about things not being what they used to be.... e.g. We are loosing our grip on being "necessary" in emergency situations, and in international good will. Even those "purposes" are not completely gone, however. But I don't agree that advancement of the radio art, by itself is the thing that will save us.

I think we will still have a hobby if we can show that people of all walks are developing personal skills that can fill present and future niches in our rapidly developing technological environment. This is the thing we should focus on. If, along the way, we implement some leading technology, so much the better.

My original posting was meant to counter the argument that says we won't have a hobby if we don't fill the spectrum "we own" with a bunch of leading edge (and lagging edge) wide-bandwith stuff to "prove" we need it. Lyle pointed to some of that fallacy with his comments about collectively low-usage FM repeaters, reserving valuable spectrum.

We may not be able to justify exclusive use of some of "our" spectrum. It is probable that we will end up with less or will have to share more.
In that case we will be forced to use more effectively what we are left
with. The use of spread spectrum may be part of the answer. But apparently we will not be cutting the edge even with that.

On 18 Nov 96, Don, wb9mjn@wb9mjn.ampr.ORG wrote:

>In our area here, there are not "willy nilly" use of 2 meters for
back bones.

>Its mostly for 1200 baud access. Having operated SSB packet, as well as FM
>packet I know you are wrong. And rather than go to the more expensive SSB
>route, to improve spectral efficiency, Packet Radio went to the .5GFSK modul-
>tion, and DSY Bandwidth Reduced MSK. Both of which have similar, if not bet-
>ter Baud/Hz efficientcy than a 1200 baud FSK SSB technigue, and one technigue
>is significantly more economic. But 1200 baud FM hangs on. And its not without

Perhaps. But the 2-meter band alone has more spectrum than all the HF

bands combined. 2 meters, except for some satellite work is basically

a local band while those tiny HF bands must serve world-wide traffic.

We are not even close when it comes to efficient use of VHF and UHF.

Don continues:
>[.....] We are not employing radio technologies
>at our disposal. The activities you point out are all worthwhile, but on the
>non-HF frequencies, many activities are precluded by the ocupation of

>spectrum by old technology.

Sometimes I think that we have so much VHF and UHF spectrum that we have incentive only to use it UNwisely. In the competitive demand for spectrum, we must focus on our greatest purposes.

Also on Sat, 23 Nov 1996, gary@ke4zv.atl.ga.us (Gary Coffman) responded
to my following comment:

>>[.....]
>>we, without pecuniary interest, cannot be expected to produce new
>>technology. It is in spite of that handicap, that we sometimes do.

Gary replied:

>I would suggest that it is *because* of that *advantage* that we
>sometimes do. We aren't restricted by demand for quarterly bottom
>line results, we aren't pressured by marketing to get half baked
>products out the door, and we are free to pursue avenues of research
>which may not pay off for 10 to 20 years (if then). Those operating
>"for profit" don't take that long view. [.....]

Although it is difficult to cite examples, Gary makes a good point. (He even cites an example not quoted here.) We really should be doing

more of that.

For the most part, though, amateur radio has adopted technologies already
marketed. Still, I'm afraid there is nothing that drives technology more forcefully than a "bottom line." Hams can't be be expected to justify their existence by that. it's pecuniary interest.

The use of commercially developed technology in ham radio is not necessarily bad. Even some old technologies continue to serve best. We would be nowhere without them. I designed and built my receivers and transmitters when I started out, but there's no way I could have the capability I have now without Icom, AEA, Intel and a myriad of others. (Sorry about AEA ;)

The really important thing for amateur radio is personal development as it relates to radio. We pride ourselves in having participants from

all walks who have this common interest. We are not all scientists, engineers or even technicians, but we all have a great interest in learning and applying these technologies. Although a nice argument can be made for pushing the radio art, personal development is by far, more convincing. THIS is still our strength.

73,
Dick - W7DHS

Of course. Just have a look at the "axparms -assoc ..." command.

Well, no, the newsgroups do *not* have worldwide distribution by
definition, though they often have it by poster carelessness.
That line up there in the header marked "Distribution:" can be
set to limit distribution to a city, state, nation, or the default
value of "world". Only if you leave it at default do you get
worldwide distribution.

If your news software doesn't show you the header by default (it
should), here's what the header for this message looks like:

I'm not suggesting paying twice for a product. I didn't pay for the source code when I bought the product. All I paid for was just one copy of a binary image of the code. So I don't own a copy of what I'd like to buy. I could reverse engineer the binary, but that's a PITA I'd be willing to pay a nominal sum to avoid having to do.

That chip is available from i believe JDR Microdevices not sure of the address but im sure they have a web page. Also FAR circuits has several circuit boards available for building the TCM3105 based modems and they have the chips available with these boards for $10...check out their home page at WWW.CL.AIS.NET/FARCIR. Hope that helps you out some..in fact if that issue of 73 is the Feb 96 article they have the board AND the chip for $14

6177. SYSOP 19 Minutes Release before SYSOP 20 Meeting

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-26 00:00:00 UTC
From: J.M.Dundas@btinternet.com
Message-ID: <57e4om$5ke@snow.btinternet.com>
Source record: 33377

Hello One and all,
The following are the minutes from the UK SYS19 meeting. These minutes are being sent out once again before SYS20 for any comments or amendments.
SYSOP 20 will take place in Glasgow on Saturday the 7th of December. Futher information will be sent out shortly.

rgs John Dundas GM0OPS @ GB7SAN
E-Mail J.M.Dundas@btinternet.com
Tel: 0141 638 7670

Part One of Two Sections

MINUTES of SYSOP 19 held on Saturday 6th July 1996 at London House, London at 11.00am.

Sponsored by the RSGB DCC and organised by Sunpac

PRESENT

G8SFR, G6URP, G1DVU, G4WPT, G3ZYP, G1FIP, G3ZFR, G4EGH, GM0OPS, G7EIA, G7MMF, G6YLW, G1XGP, EI7GM, G0MHD, G8OQN, G6KMQ, G7IUB, G6BSK, G8TBF, G7LED, G8UAQ, G6TLA, G8PEE, G1TLH, G4EAN,
Neil Marr and Karen Scott Radio Communications Agency.

OPENING OF MEETING.

Meeting opened by Steve Morton, G8SFR, on behalf of the RSGB DCC.

1. ELECTION OF CHAIRMAN FOR THE MEETING

G4WPT was proposed by G1DVU and seconded by G8OQN. There were no other nominations, Chairman for Sysop 19 G4WPT.

2. APOLOGIES:

G1ZQB, G1RUY, G3ZPB, G0OFE, G0WCI, G8DHE, GU8IRF, G6JNS, G3LDI, G0OPC, G7AHE, GM1AHC, G4HRM, G1KQH, G8JHE, G3ZXN, G7AYI, G4MRU, G8ASO, GU4WRP, G4FPV, G8AMG, G6FCI, GM3YEW, G0LGS, G1VGM, G0HFO, G8VRI, G0JDR, G6TJZ, G1GDB, G4OAR, G0EMM, G0UQQ, G8KHC, G4ZLY, G6FCL, G4AJJ, G7PFT, G1YAA, G7JYF, G4IYK, G8LSN, GM4WZY

3. MINUTES OF SYSOP 18

Approval of Minutes of SYSOP 18 Proposed by: G8OQN Seconded by: G1DVU

4. ITEMS/ACTIONS OUTSTANDING FROM SYSOP 18

a) SATGATE ROUTING OF MAIL.

It was proposed at SYSOP 18 that information about routing of messages distributed by Satgate should be available to ALL Sysops.

This information has now been distributeded on the network by GB7LEN. No further action required.

b) ADDITIONAL 70cms FREQUENCIES FOR PACKET USE

It was proposed that a working document should be put to the VHF Committee to investigate the use of more frequencies on the 431MHz band.

G8SFR: Discussion has taken place between the DCC and the VHF Committee, who have now put forward a proposal which would allow more frequencies for packet use on the 70cm band.

430.000 - 430.800 Digital Comms
430.900 - 431.990 Digital Comms subject to 100km exclusion zone around London
432.000 - 439.400 As present
439.600 - 439.750 Digital Comms
439.775 - 439.975 Digital Comms as at present

G8SFR: These proposals are very much still in the discussion stage between the DCC and the VHFC and other RSGB committees. There is still a restriction for stations who operate within 100km of Charing Cross, London. These frequencies can be put to good use outside the area.

G8OQN: Would it be possible for stations within the 100Km area to receive on 431MHz?

G8SFR: Yes. The DCC will keep you informed of progress with this proposal.

c) PASSWORDS

See Agenda Item 4e.

d) NATIONAL PACKET MAP

G7LED volunteered to co-ordinate with G4FPV in organising an updated UK Packet Network Map.

G7LED: G4FPV gains much of his data from node hoping and some from sysops. G4FPV uses the information to produce a printed map. I run a database which can be updated remotely by network sysops and the information will be passed onto G4FPV for inclusion in his maps.

After some discussion, it was agreed that the G7LED database would be useful if it were used.. BBS forwarding information would also help many sysops unsure which way to send mail. G7LED agreed to make available two databases, the second to be used for BBS forwarding partner information. G7LED agreed to send out information on the network explaining to the Network Sysops how to access the database and input updates.

e) PGP/M-FILTER/PASSWORDS

At SYSOP 18 G7AYI agreed to write a paper on the subject of PGP, M-Filter and passwords for the RA and the DCC.

G7AYI could not attend the meeting and the paper was submitted on his behalf by G3ZFR.

The paper was read out by G3ZFR and was split into four sections: M-Filter, PGP, Passwords and A Combined System.

A discussion took place on the content of the document.

G6BSK proposed that the name itself is misleading and should be changed to User Authentication Signature Seconded by G8OQN. The proposal was carried.

The meeting asked G3ZFR to pass onto G7AYI various comments and suggestions for inclusion in the current document and to thank him for his work so far. This was noted by G3ZFR.

f) LOCAL VARIATIONS INTO 2M CHANNEL USE

At Sysop 18 G7AYI volunteered to write a paper on the subject.

G7AYI could not attend the meeting but passed on a message to say that little input had been received after various requests for comments had been sent out on the Network and that the document was not ready at this time.

5. MESSAGE SIZE

Proposal: G4EGH. That agreement is sought regarding the maximum message sizes. Proposal: GU8IRF That message sizes should be increased to 25k.

A discussion took place on the various aspects of the network and G1TLH reminded the meeting that the network has moved on and that message sizes should be increased.

PROPOSAL: G1TLH I would propose that the maximum size of messages on the network should be scrapped; seconded by G8OQN. Proposal carried. ("on the network" was understood as "in transit").

6) PROBLEMS WITH MAIL DISAPPEARING ON NETWORK

G1TLH. Problems with mail forwarding have been experienced in East Anglia and tests have been carried out to identify the problems. The results of tests have been disappointing. Somewhere in Central England mail is going missing for some unknown reason and if this sort of problem persists we could end up losing users.

G3ZFR: I gave an overview at Sysop 17 at why some mail is going missing. This is down to how the mail is being forwarded from the BBSs on the network.

A discussion followed on various topics of problems associated with mail forwarding ie Nodes/BBSs going off air, links not capable of handling traffic etc.

PROPOSAL: G0MHD. The meeting recommends that ALL Personal mail should be forwarded in ONLY ONE direction. BBSs forwarding Personal mail in more than one direction simultaneously may come up against a known problem which causes mail to be lost on the network. Seconded by G8OQN. Proposal carried.

Some sysops agreed to follow up with further investigations to try to ascertain the source of the problem.

End of Part One of Two Sections.

Final Part of Two Sections

MINUTES of SYSOP 19 held on Saturday 6th July 1996 at London House, London at 11.00am.

cntd.

7) LOCAL ENTRY LIMITS FOR MAIL.

G1TLH. Do we want local entry limits of messages?

A discussion followed on the current mail sizes which have been recommended to the users.

PROPOSAL: G7LED.. Binary files (7plus) should be increased to 7k with maximum of 10 parts and that text bulletins and personal text messages should be increased to 15k at the point of entry into the network unless local advice was to the contrary. Seconded by G7MMF. Proposal carried.

G1DVU: The DCC will amend the Packet User Guidelines accordingly.

8) DCC TO ADMINISTER SYSOPS MEETING MINUTES AND PROGRESS ACTIONS

G4EGH proposed that the DCC should administer the minutes of the Sysop meetings and should monitor the progress of any outstanding actions from the minutes in order to provide continuity.

G1DVU. The DCC do not wish to administer the minutes of the sysop meetings.

A discussion followed on how to maintain the minutes of the meeting and track progress of outstand items from previous meetings. The meeting was reminded that the standard practice todate was for the out going sponsors of the meeting to pass the minutes onto the next organising group. It was agreed that this should continue.

A discussion then followed about the contents and size of the minutes.

PROPOSAL. G4WPT. This meeting proposes that all minutes of the National Sysops meetings should be in standard business format. Seconded by GM0OPS. Proposal carried.

9) G7AYI. RELAX NOVs TO ALLOW MORE THAN ONE QRG PER SUBBAND

Discussion followed on various current allocations of the 2m bandplan. It was brought to the meetings attention by G8SFR that this allocation of only one frequency per SUBBAND goes back to 1988 and the original NOV document

which states that you are only allowed one frequency per subband. The new NOV document should get over this problem.

The discussion continued with various aspects of ways of better frequency management on the 2m subband.

PROPOSAL. G4EGH. The meeting recommends that 12.5kHz equipment be used on 2m 1200 baud user ports within two years to make available additional channels which the DCC are requested to investigate. Seconded by G1FIP. Proposal carried.

10) A.O.B.

a) REGENERATIVE PACKET REPEATERS

G1TLH. Looking ahead to the future why cant we arrange our bandplan to use 7.6Mhz splits for regenerative packet repeaters.

G8SFR: There are 7.6Mhz IARU packet repeater allocations and the DCC are in Correspondence with the VHF committee on this topic at this time.

A discussion followed on regenerative repeaters.

PROPOSAL. G1TLH. The meeting requested that the DCC make available a 7.6Mhz split allocation for digital regenerative nodes. Seconded by GM0OPS. Proposal carried.

b) ANNOUNCEMENT ON 23cm RADIO EQUIPMENT.

G1TLH made an announcement that progress has been made on the supply of 3B 23cms radios from Germany. Some units have arrived and are now being built for test and evaluation purposes. Discussions are underway with the author of the board with the view of producing the board in the UK and supplying the radio in kit form.

G8STW has various new TNCs and add ons which can easily increase the operating speed of TNC2s and clones.

c) USE OF AX25 FREQUENCIES IN SUNPAC AREA

G8OQN. The use of 433.675Mhz by dx clusters in the SunPac area. This question was directed at G1DVU of the DCC.

A discussion followed on the point that the current recommended bandplan allows for four AX25 channels on 432/433Mhz and they are available for general AX25 use, and are not specific to BBS or DX Cluster.

d) LETTER FROM G3ZXN TO RA/RSGB DCC.

GM0OPS. I would like to bring to the attention of the meeting the message which was sent out by G3ZXN on the network, this message has also been sent to the RA.

Contents of message read out by G4WPT.

A discussion followed on the content of the letter.

PROPOSAL. GM0OPS. That this meeting does not support the views and contents of the letter sent. Seconded by G1FIP. Carried by the majority.

11. QUESTION & ANSWER SESSION WITH KAREN SCOTT AND NEIL MARR OF THE RADIO COMMUNICATIONS AGENCY

a) Q. EI7GM. A local user has sent out a message in French and the BBS sysop rejected it because he did not know what the message contained. What are the RAs views on messages in a foreign language.

A. Neil Marr. We are looking at this with the RSGB. We are concerned with the fact that we do not know what the message is saying.

b) Q. G1TLH. Temporary permission to run a node unattended. If someone is runs an unattended node and then proceeds on holiday that node has to be shut down. We need some mechanism to sort this out and get temporary permission.

A. Karen Scot. We are talking to the MoD about block clearance of frequencies and until then unattended temporary operations permission cannot be granted.

c) Q. G1FIP. At Sysop 17/18 the topic of advertising was discussed. What does the RA think about it and what is the chance of it happening in the years to come?

A. Karen Scot. There is a danger of commercial companies putting on adverts and if pressed to be more specific we may be forced to impose more restrictions.

d) Q. G6BSK. Going back to PGP, does the new name of User Authentication Signature sound any better.

A. Neil Marr. Yes it does.

e) Q. G1TLH. Spread Spectrum have you had any discussions on the use of this mode?

A. Karen Scot. We are planning to discuss it with the RSGB.

12. The next National Sysops meeting will be hosted by the SDX Cluster Support on Saturday December 7th in Glasgow.

Closing comments.

Thanks to the DCC for sponsoring the meeting.
Thanks to the RA for attending the meeting.

Meeting closed at 18.00

Mintues Prepared by John Dundas, GM0OPS, Secretary for SYSOP 19

I had a DSP-232 for about a week. One of the main problems was a birdie at 145.085-145.105. This is right in the middle of the local packet bbs area. With a cable connected to the 232 my ht picked up this birdie from 35 feet away (s9). The case by itself tx's up th 5 feet away. I checked the unit for proper grounding, and found no problem areas. I tryed to use the unit for 9600 sat work and was only able to get a weak signal from KO-23. I took my 232 back to HRO for an exchange, thinking that I must have gotten a defective unit, but the one the shelf did the same thing. On the way to HRO I talked to two people both returned their DSP-232's for a refund. Knowing the state of AEA, (I called late last week for tech help. The recorded message said the company was being 'bought' and any tech problems or servive warrenty work needed, call ARRL in about a month). I was very lucky to get my money back. I now plan on buying a TAPR DSP93 kit.

I know I've seen messages like this before but then I was not ready to set up TCP/IP at my home station again. So.....

Are there any Win95 drivers for using a standard TNC on a serial port with the native Win95 TCP/IP stack? If not, what are the alternatives? I'd rather not have to resort to setting up a LAN in my home to a Linux box just to get on to TCP/IP.

Does Trumpet Winsock work? Please let me know what you've got working.

Thanks.

>Any ideas for a modem with output that looks like baseband video?

Some years ago, before the advent to DAT, there were boards which
allowed you to backup data onto a VCR. The data was encoded as
white and black pixels in the active video area of a regular NTSC
signal. There was enough ECC included to allow operation with
VHS VCRs, so it would probably be robust enough for over the
air transmission as well. Of course these systems are now obsolete
and it might be difficult to find them. You could build something
similar, however.

That would give you 480 kilobytes per second. If you were brave,
you could use 8-bit greyscale for the pixels instead of just
black and white, and that would give you 3.84 megabytes/sec.
Video frames are a natural for a block code ECC like Reed-Solomon,
interlace is automatically included for protection against burst
errors, and the NTSC sync offers very positive data sync.

It isn't the most efficient way to send data via radio, but it
is a workable method.

>Two Questions:
>
>1. Can any commonly available 2m HT's be used for 9600 packet?

The Wilson SM1402 and Mark IV should work. And a Motorola HT220 would probably work too. As long as the HT is crystal controlled, uses direct FM modulation, and doesn't have too tight IF filtering on receive, it should work. None of the synthesized HTs are likely to work correctly, however. That's because the PLL loop filter distorts the modulation.

>2. If not...What are some economical radios that are available?

Notorola Mitrek and Micor. Icom IC22A. Regency HR-2B. Etc. (These are all old and cheap, IE in the $25 to $50 range at hamfests.) Basically, any crystal controlled direct FM radio without excessively tight IF filtering should work. Synthesized radios are unlikely to work unless they use IF modulation. IF modulation works because it is outside the phase locked loop, but IF modulation is typically found only on all-mode radios (except the Azden PCS9600D, but that's a 70cm only radio).

Don't believe the advertising hype of "9600 baud ready" on new synthesized FM radios, it isn't the truth. There are only a few really 9600 baud ready synthesized 2m voice radios on the market today, the IC-706, IC-275, IC-821H, and Yaesu FT736R, and they all require some (at least slight) modification to work properly. They all use IF modulation, and all cost upwards of $1000.

There are some real plug and play 9600 baud data radios on the market, however. Kantronics offered one (though I think it is out of production), MFJ offers one, and the TEKK radios work excellently on 70cm. These radios are crystal controlled, optimized for data, and best of all are cheap compared to synthesized voice rigs (under $200).

I think the Hamtronics kits should work fine too. They are crystal controlled direct FM. Crystal control is perfect for a packet radio, because you want it to *stay put* on its LAN frequency and not go wandering off where it doesn't belong (like to a trunk frequency). You want it to be where the network can always find it when there is inbound traffic for your station. Network routing can't work if you channel hop. So the fact most synthesized radios won't work for 9600 baud isn't a drawback, it is really a plus since it enforces some network discipline.

Well, the PK-232 isn't very complicated. Why don't you just
fix them yourself? As long as the ROMs are Ok, it's a straight
forward job. If the ROMs are bad, you're hosed now that AEA is
gone. What are the symptoms?

>
>I was looking at the Baycom radio modem also. Could someone please tell
>me the advantage of using a TNC vs. going the Baycom route?

Frankly, for 1200 baud Bell 202 over voice grade FM radios, there is
little if any advantage over Baycom to going to a separate TNC. The
Baycom modem and software drivers work well enough. The only possible
downside is that the computer must remain powered. With a TNC with
on-board mailbox, you can shutdown the computer and still receive
AX25 packet mail or act as a digipeater. That's the only advantage
to a TNC for 1200 baud Bell 202 packet. If you keep your computer
powered, there's no reason to use a TNC.

At higher speeds, you need a better modem, but a TNC still isn't
likely the correct solution. Better is a digital interface card
in the PC (like the Ottawa PI-2 card), and the proper software
drivers (built into recent Linux kernels, or in NOS). That'll
let you easily handle 9.6kb, 19.2 kb, or 56 kb with the appropriate
external modem. The exception is if you're using a laptop because
it has no slots for internal cards. Then you may still need the
TNC.

To a large degree, a TNC is an obsolete idea. It was intended to
work with a dumb terminal (*Terminal* Node Controller), and few of
us use those today.

How much would you pay for one, if it was available? I'm just curious.
If there is enough interest, and the unit price was right (cheaper than
buying Linux on a CD)...

No. The alternative is to run JNOS in a DOS window. You really don't
want to run your Win95 TCP/IP out the comm port anyway. Keep the two
systems seperate. That way your ISP network can't get to your Radio
network.

>
> Does Trumpet Winsock work? Please let me know what you've got working.

No.

Get the latest version of JNOS on:

ftp://ftp.ucsd.edu/hamradio/packet/tcpip/incoming

Use the binary uploaded, or recompile the way you want. If you don't
have Borland C++, then you might look at the KA9Q version of NOS, as
Phil has reworked his to compile with GCC I've heard.

One other alternative is to get the K5JB (SK) PIPE.COM program. This
is a Packet Driver designed to pipe data from two DOS windows to each
other. With this, you could have JNOS settup for radio in one DOS box,
and another JNOS set up for phone dialup, and PIPE.COM would connect
the two.

Best bet is to just get Linux...

Win95 just isn't designed for slow networks.

Steve

6191. APT reciever

> and in the expermental portion of the bands.

Please explain. Internet phone is transferring voice through the use of TCP/IP, which almost always is encapsulated in AX.25 packets. Every AX.25 packet (should) have the users callsign in the header, thus satisfying the ID requirement.

TCP/IP is public, AX.25 is public, Internet Phone is public. I fail to see ANY rules problem with this approach.

> Seems this is the
> actually way radio should go but we must provide an easy way for the
> FCC to listen in to each conversation before we can do it full time.

As long as you're using public systems, and can produce documentation for any systems that you build (modulation techniques, coding systems, etc.), the job of interception is the FCC's concern. Once they have the intercepted data, all you have to say was "I was using JNOS and Internet phone" and it's up to the FCC to "reverse engineer" your transmissions.

> >hmmmm

Maybe the jokes aren't funny. But neither is what lawyers are helping to do to our hobby, our country and our world.

People oftn use humor to release frustration and tension. The cost of doing business with and the results of lawyers causes both. No wonder there are so many lawyer jokes.

Perhaps if lawyers had a canon of ethics which kept them from taking frivolous cases, charging exorbanant rates, raping those who win large judgement sums, and taking or making action that hurt groups like amateur radio they would have a some respect from the general public.

Of course, some lawyer will try and justify or nullify the above. That's what they do.

I'd have to agree with Steve. After writing and debugging a packet
radio driver for Windows 95/ Windows NT, the stack is not tolerable to
slow packet networks. Now if all Amateur IP networks were 19200 or
higher, it woudn't be a problem. But I had nothing but problems at
1200. So I stopped developing the driver. Sorry.

Hi there!

I am trying to get some sort of Internet connection going for the local packet users. However, I am not sure as to what to do. I used to operate a landline BBS connected to Fido and Internet via UUCP. But I am lost as to what NOS actually does.

What is needed to connect to a NOS node and send mail,etc.? Will a generic packet terminal do or does a user have to run NOS himself? My knowledge about NOS is below of what I found so in the software docs for TNOS for example. I guess I'll need some basics.

Also, to connect a node in my shack to the Internet via land line, what's needed? There is a local provider offering dial-up PPP only. Or I could call LD and do UUCP. Is either possible? Or do I have to do something else?

I do live in a rather remote area and there is no NOS node anywhere near I could possibly connect to via my packet setup. Any answers to my questions or tips of where to research would be very much appreciated!

David Woolley <david@djwhome.demon.co.uk> wrote:
>
>Versions of nslookup do exist for Windows. NT 4, has one included.

nslookup can query the domain name system (DNS) and, for example,
return the IP address(es) associated with a domain name, such as an ampr.org
name, (and conversely, return the name associated with an IP address).

Many versions of nslookup will also dump the whole zone file (DNS
source file) for a domain. Alternatively, the zone file for ampr.org
appears to be stored at ftp:ucsd.edu/hamradio

> -rw-r--r-- 1 32767 32766 1151143 Nov 26 13:02 ampr.org

The file ampr.org appears, in fact, to be the output of an nslookup
command. The first few lines look like, (I deleted most of the
44205 lines of ampr.org):

> > ls -d ampr.org
> [ucsd.edu]
> ampr.org. SOA ampr.org brian.ucsd.edu. (96111913 36000)

The file amprhosts contains the interesting information from the above file in a bit less esoteric format.

Note that file amprnets lists the people who have volunteered to assign 44.x.x.x addresses in particular geographic areas.

Without a doubt, far more than anyone wanted wanted to know, from:

If you really want it, you can get it, but at a cost.
There is a global satellite system called Inmarsat, which have telephone, fax, data and high speed data services.

There are several suppliers of equpment to this marked. Nera is one of them. As I work as with data applications on this equipment i will be biazed in favour of our equipment.

Inmarsat B
Voice
Fax 9,6
Data 9,6 kbps
Data 64/56 kbps
Telex

Inmarsat M
Voice
Fax 2,4
Data 2,4 kbps

Inmarsat Phone
Voice
Fax 2,4
Data 2,4 kbps

Inmarsat C
600 bps store & forward

Inmarsat D
Pager system

The maritime systems comes with autotracking or unidirectional antennas. With a Inmarsat B system you can connect a CISCO router directly to the units HSD channel and configure the CISCO to do DTR dial or V.25bis dial access to the Inmarsat B system. Many ISP (internet service providers) support dial-in ISDN connections using PPP and CISCO routers.

With this system you get a digital connection all the way from the boat to the internet.
There are more information available at www.inmarsat.org and www.nera.no.

I will also be happy to supply more info if wanted.

Best regards
Sigvald

Heh, this is a common problem, and not just with the DSP-232.
The PK-232 has it too. The problem is a lack of RF bond between
the case halves. If you sand the paint off the mating surfaces,
and use a screw every 5 cm (as is standard VHF shielding practice),
those harmonics of the reference oscillator stay inside where
they belong, and don't radiate all over the shack.

How about at 9600? We have two 9600 baud repeaters here in
Colorado that are routed to each other and to a 56kb leased line to
the Internet. Would your driver and the Win95 stack work in
this environment?

Also, we'll be moving up to 56kb (WA4DSY modems). Do you have
any interest in finishing your driver for that environment?

I'd pay $50 or maybe more. I understand that Linux is all ready to go.
But I don't want to have to boot Linux to check my email when I'm trying
to get some work done under Win95.

Well that's not a factor for me. I don't access the Internet from home.

> Get the latest version of JNOS on:

Thanks for the info. I may have to go that way but I would prefer some
other method, if one exists.

> Best bet is to just get Linux...

Actually I already have Linux though with an older kernel that does not
have the AX.25 support in it.

> Win95 just isn't designed for slow networks.

This may be but surely some of the faster Amateur TCP/IP networks are
as fast as a slow dialup line. I'm a little confused as to why someone
has not come up with a solution to this.

If someone could come up with a packet driver for Win95 I think that more people would give TCP/IP a try. I can set up Linux or NOS to do this (I've set up NOS before and I program Unix at work) but I would rather not have to do this at home!

I found that Morse Trainer-US V1.1.1 still works OK on my
PowerTower Pro 225 (Macintosh clone), which uses a 604e processor.
All the other ones I have fail to work.

Take a look at John Seney's web pages. I found some info on the
Morse stuff on http://www.mv.com/ipusers/wd1v/page5.html

Here is the boilerplate from that page about Morse Trainer:

------begin quotation-----

MORSE TRAINER-US V1.1.1
MorseTrainer is a powerful tool for learning and training Morse
code. Features: Three different training modes: user text, random
text, library text; Arbitrary signal pitch and timbre; Arbitrary
speed and tempo; Multi-alphabet support; Random text generator;
Text library editor; On-line alphabet; On-line manual; Help
Balloons; And a lot more. New features in 1.1: Enhanced sound
generator, volume control and risetime control. The pitch is set
in steps of 10Hz instead of using MIDI frequencies; Speed and
tempo limits increased to 80 words/minute as a result of the
enhanced sound generator; User-selectable font in the Misc
settings dialog. FREEWARE!

This version uses TrueType fonts instead on bitmaps fonts so
that the user can distinguish 0(zero) from O(character).
Furthermore speed and tempo can be given in either
characters/minute or words/minute. Archive is available
mac.archive.umich.edu, path: mac/util/organization/ Author is
available via internet: sund@tde.lth.se

-----end-----

Good luck and remember to keep the character speed high,
20 wpm or more, so you will learn the real sound of the
code. Otherwise, you will get stuck on dots and dashes and
have to "un-learn" those bad habits.

-John, AC6VV

Hi Martin,

The bid is 62303_GB7SAN. Will send down the agenda list also.

Rgds John

SYSOPS 20 Attendees List Update No. 002 Dated 27 Nov 96.

Hello One and all,

The following have indicated that they will be attending the SYS20 meeting
to be held in Glasgow on Saturday the 7th of December:

CALL Position
GM0JQE SYSOP GB7AYR
GM7DUG ASST SYSOP GB7AYR
GM0OPS SYSOP GB7SDX
GM4CXM ASST SYSOP GB7SDX
GM1FML SDX Support Group and MacPac Committee Member
GM4COX C.S.F.M.G Repeater Group
G1DVU SYSOP GB7SXE DCC Member
G4HIP SYSOP GB7BBC
G4OAR SYSOP GB7OAR
G7HUD NWPUG
G1TLH SYSOP GB7TLH
G4AVN SYSOP GB7TDX
G7UZS ASST SYSOP GB7TDX
GM4WZY SYSOP GB7NDX
G0BLE SYSOP GB7BLE
GM3YEW SYSOP GB7YEW

The following have sent in their apologies:

GM4ANB, GM7AOM, G4AJJ, G3ZXN, GI3TLT, GI4WRI, GI4AHP, G0LGS, G8JHE, G7OPJ,
G0UHK, G8OQN, G4EGH, GM4UPX, G7JHE, GW8TVX, G7JYF

(If you have been missed of the list please let me know)

If you would like to attend this important meeting at which the Radio
Communications Agency will be present, then please let me know. These
meetings are a good way to put forward your views and the views of your
group and users to the RA and the RSGB DCC.

This is good and essential advice, and I'm really glad that nowadays
people recognize the problem. It's half the solution, or less than
half; the most important thing (IMHO) is learning the long characters
first (at high char speed of course) instead of the way I was crippled:
if you learn the simple ones first, then you end up making as many
decisions per character as there are elements in the character. Gak!
Furious activity in one part of the brain, while another part of the
brain is sitting around just getting frustrated.

ROM's are sometimes like oil wells. When you have a burner, all you need
is one good one!

:)

If they never solve the sale or public release, someone will eventually slant
drill the field, I would guess, advocacy not withstanding. A real advocate
of the situation might even be able to CH7 them and class action the shrapnel
if much ado was made over something at that point.

:)

6227. AEA DSP232 Rom Update

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-27 00:00:00 UTC
From: g.grey@netaccess.co.nz
Message-ID: <57i6dp$fi9@granny.mac.co.nz>
Source record: 33328

Hi,

I was pleased to receive firmware updates for the DSP-232 from AEA yesterday, 26 Nov.

I fitted the 3 chips last night and there seems to be a large improvement in performance on 1200bps packet. I can run TPK 1.82 and Winpack 6.1. I don't need the hard wired mod for the serial port DCD any more for these programs. There does not appear to be any acknowledgement packet clashes. Much smoother all round.

The old chips were labelled V1.0 L30.

My new chips were labelled V1.0 L31, but the DSP sign-on message shows Ver 1.0b Lot 30, Release date 06.Nov.96

Are these new chips a beta version? Is it the latest code?

Has anyone else received the same chips?

Regards
Gordon, ZL3AAI

I am also using Paket 6.1 under OS/2, only in a DOS session window, while typing this note dialed into my ISP over a phone line. Isn't TRUE multitasking great?

No updates to Paket 6.1 that I am aware off.

I am thinking about switching my packet setup over to an APRS beacon - digipeater though.

Hello Winhackers

As I've received a rather LARGE number of questions about Winpack version 6.10, I'd decided to put up an FAQ Web page to get you through some of the downloading problems and registration issues.

Drop in for a browse. I hope to have a more comprehensive FAQ up and running in a few weeks to cater for the technical queries....

Point your browser to the Winpack web page:

http://www.acay.com.au/~vk2yx/winpack.html

Cheers..Peter

As a keen supporter of the use of PGP - User Authentication Signature,
I am interested in how this subject is progressing. I was advised by
a number of Hams in the UK that messages with PGP Signatures would be
removed from the UK packet network.

Can anyone provide us ALL with information of how this is progressing
? I would like to provide some feedback to the hams in VK as to the
current positon in G Land....

I'm glad that a VERY sensible statement was made here, changing PGP
from PGP encryption to User Authentication Signature.

Thanks..Peter..vk2yx

Jay,

It must be a local problem. It works for me. Try it a couple of times.
Sometimes the DNS cache needs to be refreshed and a second or third attempt
does the job. Netscape is a little impatient with DNS.

As the CEO of Inmarsat said at a conference, I attended a few years ago,
"It is a wide-held misconception that Inmarsat only provides expensive
services to large ships. I would like to correct this error. Inmarsat
also provides expensive services to small ships"

If you only need email, try looking at "www.pinoak.com". I do not have any
personal experience (except with Clover Modems), but at least it looks
interesting.

Cheers, ...Erik.

Some time ago I find scheme, PCB layout of TNC on a some ftp site.
Today I put this file on ftp://ftp.stack.net/pub/ham/packet/dixtnc.zip

Interesting, possibly to find on Internet sheme, PCB layout for making
more new TNC2(H,X), TNC3 ?

Source record: 33336

I have a Yeasu FT-2500M working as my packet radio right now. When I first hooked it up last May, I noticed that the radio will send the audio thorugh the mic jack. This is the way I had left it up till ths morning.

I was doing some work on my power suply, and figured that I would add the mini plug to go in back of the radio, and kill the internal speaker (thus not having to hear the noise of the packets). All has gone well, except one thing, there is still audio coming from the speaker. I thought if there was a plug in the jack, that was supposed to kill the speaker. Am I wrong? Is there something wrong with the radio? I would snip the wires to the speaker, but once I get the outdoor anteana up, I am putting this radio back in the car.

Any suggestions?

Speak for yourself. In this area, having an autominous TNC working on the radio stuff is still desirable over bogging the computer down with another process. This is especially the case when stacking TNC's. A lot of us in this area have nodes on 145.01 - 145.09. Also, running a dumb terminal and a TNC is a lot cheaper than trying to get a pc good enough to run multiple processes.

This is starting to sound like a flame, but it is not intended to be, sorry.

Greetings,

I am planning on building and buying the hardware to interface my Kenwood TS-60s to my computer. I am sure their are others who have already done this and have some opinion on the software available to control the radio once the interfacing has been done. I would like to hear from people who use their radios in this manner and get their feedback on what software they use and what they like or do not like about it. Any recomendations would be appreciated.

Thanks for your time and all reply's will be answered.

Mike, N2QAC.

Sigvald:

I am looking information on Nera's new MINI-M stabilized terminal.
When will it be available? Will it support data? Have you sent data using
this terminal?

I need to transfer large binary files from a 55' sailboat in the South
Pacific. Inmarsat A and B stabilized marine antennas are too large to fit
on board but I do have room for an Inmarsat M stabilized dome and certainly
for a mini-M dome. The files are, on the average, 300,000 bytes and can
either be sent directly to a receiving PC or as attachments to e-mail
through someone like CompuServe. I also need to access e-mail and dial
into Intuit using Quicken to pay bills but my major use will be the
transfer of data files.

1) Have you, or do you know of someone who has, transferred large data
files using an Inmarsat M or mini-M stabilized marine antenna?
2) What hardware and software was used? i.e. what Nera equipment,
communication software, etc.
3) What was the experienced actual baud rate for the transfer?
4) What is the best hardware and software to do this?
5) Is M or mini-M a better choice?

My timeframe is this: I need to know now if this is possible in order to
plan the next year. I will be purchasing equipment and doing test
transmissions this spring. Actual data transfers will begin in the summer
at which point I will be sending data 2-3 times a week.

Please send me any information that will help me.

Thank you,

Jeanette Denby

>
> -CjIf plugging in an external speaker does not kill the audio to the
internal speaker then you can fix that fairly easily. I am surprised
that the INTERNAL speaker still is audible while the external speaker
is plugged in. If it is NOT audible then you can pop a mini plug with
no speaker wired to it to kill the audio.

Otherwise, you can pop open the radio, replace the jack with the kind
of jack that makes a connection when there is no plug and breaks a
connection when there is a plug in it. (these are so common that you
can find them at radio shack.) What you want to do is put this jack
in the place of the existing jack, with the external speaker wired to
it just the same. What you want to do different this time is to wire
the internal speaker so that it's circuit is cut off when you have a
plug put into your updated jack. It should work great... Actually it
should work like Yaesuf should have designed it in the first case.

Greetings,

I am still looking to buy or build a Kenwood IF-10D interface for my TS-60s all-mode transceiver. This interface mounts inside the radio and serves as a buffer between the radios digital board and a level converter such as Kenwood's IF-232C interface. I am building my own level converter from readily available plans, but I have not been able to find any plans or specifications on the IF-10D.

If you have information on this interface, or have an IF-10D you would like to part with, please leave me a private Email message and I will get back to you.

All reply's will be answered.

Thanks for your time.

Mike, N2QAC.

When I worked at AEA it was rare for the roms to go TU. The tech used to replace about 5 chips generally and got about 98% on the PK-232s going. That is how they used to fix lightning damaged units for about $ 75.00 as generally it was the same chips that were blown. I am sorry I do not remember the actual chips. There many online who can lead you through the repair process of the PK-232. Might be a good time to sharpen up the skills in digital troubleshooting.

I have an FT 2500 that I use for packet.
With a jack plugged in the rear, the speaker is turned off.
The female part of the jack has a contact that opens up when you plug in the male
end.
Perhaps you have an odd-ball male jack that is not quite the right size.
I have seen this happen on other headphone type jacks.
Thats about the only thing that I can think of that would cause this problem.

> with the native Win95 TCP/IP stack? If not, what are the alternatives?

I have successfully run TCP/IP on Win95 with the use of Trumpet95 and
ethrax25/winpkt. I could run most Win95 apps like Netscape32 (3.0G).
I couldn't get it to work with the Win95 TCP/IP stack. I tried this
with a packet to ndis driver and told Win95 to use a real mode ndis
driver.

Fortunatly trumpet95 wouldn't work after 30 days...

Have you checked out Marisat C?
Works great on data and antenna is small and fixed.
Maybe does not work in South Pacific?

>
>73 de LC1MAT Marius

Well, since I haven't seen a reply by Dale, I'll take a stab at
costing out a system. The modem is $349 from PacComm. The transverter
is $550 from Down East. The digital interface card, a PI-2, is $125
from the Ottawa Group (or you can buy the Gracilis card from PacComm,
or kludge your own 8530 card). The antenna can range from a simple
homemade corner reflector to a loop yagi, and cost would range from
around $5 to maybe $100. So that comes to $1124 for the whole package.
It's about $350 cheaper if you're putting it on 1.35m or 70cm because
of lower transverter cost, IE the used MMT432 transverters we've been
using on 70cm.

As a comparison, lets look at the cost of a 2m 1200 baud setup. The
radio will cost about $300, the TNC about $150, and the antenna can
again range up to $100. So we're looking at about $550, or roughly
half the cost of the 56 kb setup. But throughput is 47 times worse.
We can cut the cost by using a surplus commercial radio, IE Motorola
Mitrek, and a Baycom on the PC, but we can't boost the throughput.

As far as using a TNC with the 56 kb modem, it can be done. GRAPES
used to include instructions for modifying a TNC2 with the modem
kits (I don't know if PacComm includes the instructions with their
W&T units). You have to soup up the TNC with B level parts and
a faster clock, and you need a KISS56 ROM. That'll let it run
56 kb on the radio side, but it'll only do 19.2 kb on the computer
side. That's Ok on a busy channel, because packet is bursty, but
it really doesn't let you get the full benefit of the 56 kb modem.

PacComm has a TNC that they claim can keep up with the 56 kb modem.
I don't know if it will or not. I haven't tried one. The Kantronics
Data Engine can keep up with the 56 kb modem, but that's pretty
heavy overkill for a TNC. IMHO the digital interface card is the

way to go, and is certainly cheapest. If you have a Mac, however, you can program the 8530 in its serial port to handle 56 kb, and you don't need an interface at all. Most hams don't use Macs, so that's rarely mentioned.

On Mon, 25 Nov 1996 07:29:19 GMT, ke4htm@bluenet.net (Jamie) wrote:

>While it is illegal to encrypt anything over the Ham band...

From which section of Part-97 did you conclude this???

I haven't been able to find anything that specifies or implies that encryption of voice or data is illegal. The only reference I have seen to encryption is 97.113-a4 Prohibited transmissions which states:

a. No amateur station shall transmit:
4. ... messages in codes or ciphers intended to obscure the meaning thereof, except as otherwise provided herein; ...

If one were to identify in the clear, switch to encryption, QSO, switch to clear, identify in the clear I don't see how this would violate FCC rules. Keep in mind that encryption obscures the information NOT the meaning of it. Since one would not have done anything to obscure the meaning of anything they transmitted how would this be illegal?

I believe what the FCC had in mind was to prohibit the use of 10-codes or "secret" codes. If one was to say "the eagle has landed" yet no eagle landed anywhere, but the phrase secretly meant something, then it should be a prohibited transmission. Obviously, the message was in a code or cipher intended to obscure the meaning thereof.

My second argument is that if the FCC intended that there be no codes or ciphers at all why go on to add "intended to obscure the meaning thereof" when "messages in codes or ciphers" would cover everything?

Also, in section 97.309-b RTTY and data emission codes regarding digital transmission:

b.Where authorized by ï¿½ï¿½97.305(c) and 97.307(f) of this Part, a station may transmit a RTTY or data emission using an unspecified digital code, except to a station in a country with which the United States does not have an agreement permitting the code to be used. RTTY and data emissions using unspecified digital codes must not be transmitted for the purpose of obscuring the meaning of any communication. When deemed necessary by an EIC to assure compliance with the FCC Rules, a station must:

1.Cease the transmission using the unspecified digital code;
2.Restrict transmissions of any digital code to the extent instructed;

3.Maintain a record, convertible to the original information, of all digital communications transmitted.

Have I missed anything? What's the consensus out there?

You seem determined to downgrade our purpose of advancing the SOTA,
first with arguments for public service and goodwill, and now with
self-training. However, the self-training aspect is certainly valid,
and a major purpose for amateur radio. We can certainly hang our hats
on this one, if the self-training we do is in relevant modern technologies.
If the self-training we do is on obsolete technique, however, we don't
accomplish our purpose.

Amateur radio has always had as one of its primary purposes being a
reserve jobs training program. We are to provide a pool of skilled
operators, technicians, and radio experts for military and non-military
communications in time of need. And we are a recruiting ground for
tommorrow's technologists. And we serve to raise the technical literacy
of the population to deal with an increasingly technical world in a more
informed manner.

But we can't do any of that if we don't stay conversent with modern
technique. We might become the best buggy whip makers and wielders
around, but that accomplishes very little in a world dominated by
the auto. To be of use, the self-training we do has to remain close

to the SOTA. The two are entertwined closely.

>My original posting was meant to counter the argument that says we
>won't have a hobby if we don't fill the spectrum "we own" with a bunch
>of leading edge (and lagging edge) wide-bandwith stuff to "prove" we

>collectively low-usage FM repeaters, reserving valuable spectrum.

Well, the fallacy is the *low usage*. Most repeaters aren't in use
most of the time. If we have some *use* for the wide bandwidth stuff,
then the argument doesn't hold. We can certainly keep high speed data
links busy, and even ATV activity might increase a lot if we could
convince people to try WBFM TV and get them hooked on its better quality.
It is a lot less lagging edge than the AM TV currently done.

Raising the average amateur level above the horse and buggy is a step
in the right direction. The radio pioneers out on the edges are so strongly
self-motivated that all we need do is get any regulatory roadblocks out of
their way, but for the herd, a bit of prodding and sheparding along the
path may be needed to keep them plodding toward greener pastures.

>We may not be able to justify exclusive use of some of "our" spectrum.
>It is probable that we will end up with less or will have to share more.
>In that case we will be forced to use more effectively what we are left
>with.

I'm not nearly as pessimistic as you are on this point. I think we can
defend most of our spectrum. But we've got to be a lot more pro-active
than we have been.

>The use of spread spectrum may be part of the answer. But
>apparently we will not be cutting the edge even with that.

Well, SS has been around for over 50 years, so it isn't exactly
new, but widespread use of it in an uncoordinated mixed environment
is certainly new. There is still a lot to learn about how to use
it most effectively, and how to do it inexpensively. Sending digital
data via radio wasn't new when TAPR started pushing that technology
either, but the result was a new and growing industry. Commerical
and military uses of the TNC2 and its derivatives is now greater
than amateur usage, and AX25 is as accepted in commerical radio
environments as it is in amateur environments (though we can
certainly do better than that today). There is often a large gap
between SOTA concepts and SOTA practice. TAPR, and amateurs in
general, did a lot to advance the SOTA practice of packet data
transmission 15 years ago. I expect to see similar things from
amateur SS, IE just as the TNC is now a common amateur appliance,
I expect to see SS equipment to be a common amateur appliance in
10 years. Icom may make it, but Icom won't have invented and
developed it.

I think you miss Don's point. There are more ways to measure efficiency
than raw bandwidth consumed. The most useful metric is information per
second per Hertz. Using that metric, much of our VHF+ usage is much more
efficient than our HF usages, which typically have a horribly low information
rate and pretty lousy signal design. I showed recently that if we used GMSK
and a simple book compression scheme, we could support 6 million simultaneous
20 WPM equivalent QSOs in a 200 kHz segment of HF. Since that's 3 times as
many amateurs as are in the world, you can see that we aren't using HF to
maximum advantage now. We are currently employing GMSK on UHF, however,
and some of us are using compression schemes. That gives a very high
bps/Hz efficiency. The difference is that because we *do* have the bandwidth,
we don't do it slow. Instead of 20 WPM equivalent, we do 84,000 WPM
equivalent. This opens up many new possibilities such as digital picture
transmission and digital voice, which we can't accomplish at low information
rates in realtime.

That's a rather odd attitude. It almost sounds like you *want* us
to lose spectrum. We have wonderful opportunities to use our spectrum
creatively, but if we lose much of it, that freedom will be lost because,
as Don notes, much of it is camped upon by old technology users who aren't
going to move. There's little chance of prying those closed repeaters off
the exclusive channels they've homesteaded.

>already marketed.

Almost every technology used in amateur radio was pioneered first
in amateur radio by amateurs. That today's amateur buys commercial
equipment only means that commercial producers have adopted amateur
technologies to the mass production marketplace. The only exceptions
to that I can think of are technologies which weren't allowed under
amateur regulations at the time of their development.

>Still, I'm afraid there is nothing that drives technology
>more forcefully than a "bottom line." Hams can't be be expected to
>justify their existence by that. it's pecuniary interest.

I believe you are completely wrong about this. Thirty years ago
there were great industrial labs in the US doing SOTA research,
but they are *gone*. The rules of the business game, at least in
the US, preclude the free inquiry needed for true innovation today.
What we see are recycled old ideas, with perhaps slight incremental
improvements, coming out of commercial R&D today. And that's *because*
of pecuniary interest. The bean counters in charge can't see past
the next quarter's bottom line (because the institutional investors
won't let them), so they won't spend the money needed for long range
blue sky work. If it isn't virtually guaranteed to work, it won't
be developed. That's not how you get innovation and breakthroughs.

>The use of commercially developed technology in ham radio is not
>necessarily bad. Even some old technologies continue to serve best.
>We would be nowhere without them. I designed and built my receivers
>and transmitters when I started out, but there's no way I could have
>the capability I have now without Icom, AEA, Intel and a myriad
>of others. (Sorry about AEA ;)

Almost everything your Icom offers is the product of mature
technologies first done by individual amateurs. There is very
little strikingly new or innovative being offered. When you put
aside the gingerbread and frills, the basic radio is unchanged

from what (some) amateurs were building 20 years ago (up conversion superhet), and does the same things at about the same level of performance as what (some) amateurs were building 20 years ago, except that the factory radio may be smaller.

About the only exception to that is DDS. They did steal a march on amateurs with that technology. They are lagging what amateurs have done with DSP, however. The IC-756, due out next month, will offer a level of DSP that I was doing last spring. (Ok, they aren't lagging me by much, but I was already using something they haven't gotten to market yet, and my whole receiver cost under $125 to build. And I'm not holding myself up as being particularly technically astute, others were well ahead of me. I consider myself a laggard in this particular area, yet I'm still ahead of commercial practice.)

Now the *average* amateur, like the *average* consumer, trails the commercial offerings in technology. He only uses what he can buy. But it is the atypical person who first does the innovative (otherwise it wouldn't be novel). Don't treat amateurs like a mass audience and pander to the LCD (lowest common denominator), look at what the best and brightest have done and are doing. That's how I stay ahead of the commercial crowd, I watch what the smart guys are doing and emulate that. I've got more DNF (did not finish) and DNW (did not work) projects than you can shake a stick at, but I've also got some really neat stuff that did work. I can *afford* to fail. Commercial R&D can't.

>The really important thing for amateur radio is personal development
>as it relates to radio. We pride ourselves in having participants from
>all walks who have this common interest. We are not all scientists,
>engineers or even technicians, but we all have a great interest in
>learning and applying these technologies. Although a nice argument
>can be made for pushing the radio art, personal development is by
>far, more convincing. THIS is still our strength.

I wonder. While there are certainly those in amateur radio who are fully exploiting its function as an experimental learning laboratory, there are also others (too many others) who resist learning new concepts, and who resist changing their methods. That wouldn't matter much except that they use their influence politically to try to hold back the modernization of regulations needed to push back the frontiers of communications technology so that those who want to fully exploit the opportunity to learn and try new things can do so effectively.

Well, we've found that it takes a different outlook to operate a network
than it takes to build one. Some amateurs are nuts and bolts oriented
while others are service oriented. It is best to let the latter run the
network. If we can offer them plug and play, they're much happier, and
we're much happier because we can hide back in the lab and work on the
next big thing.

>to the transmitter frequency (as you would get by trying to mix in
>too large steps).

Actually, you want to mix in large steps, that gives good separation
between the products, and makes the unwanted ones easy to filter.
Perhaps that's what you really meant, IE the IF should be high
enough to avoid close in products.

>>Full duplex operation allows effective employment of AFC, and that
>>makes things much easier.
>
>Well, full duplex does not necessarily mean that the transmitters are

>Many of our nodes are located in airco- and elevator equipment rooms on
>the top of highrise buildings, which don't show as wide temperature
>variations as you would probably find in a shack on a mountain top.

Yeah, we get wide temperature swings. Of course the trick to using
AFC is to only use it on one end. If you use it on both ends, the dog
starts chasing his tail. At least it reduces the number of stable

oscillators you have to maintain.

>(G3RUH, DF9IC, HAPN) with the 'effort' of buying a 56kbps modem and
>a transverter, I still see quite some difference. But apparently we
>have different viewpoints on what effort really is.

I consider effort how much of *my* time I have to spend to accomplish
the task. I can earn the money a 56 kb setup costs in lots less of
my time than I can build one of your 1.2 GHz PLL rigs and its modem.
I don't build just because I can, I build when I can't get what I
want any other way, like when I'm working on something new and novel
that's not available commercially.

>>>The S53MV 1.2 Mbit/s design looks nice, but there is no room in the

>Interesting... don't you have any FM ATV and other 23cm activity over
>there? Of course, for this network we would need somewhere between 20
>and 40 different channels, like we now have in the NBFM link system.
>That does not really fit within the (maybe) 10 MHz that we could squeeze
>out of this band.

We've got 1 ATV channel active on 1.2 GHz over here, and 1 active (sort
of) NBFM repeater. Other than avoiding the satellite and weak signal areas,
the rest of the band is available for just about anything we want to do.
Our band may be wider than yours too. (We do most of our links on 70cm
because it is quite a bit wider than your 70cm band.)

Of course band occupancy may vary widely from area to area, but
we are the 9th largest metro area in the US, and we have very little
occupancy of this band at present. I'd like to see that change. If
the FM ATV boys won't use it, then we can use it for wideband data.

I'd be even happier if this system were at 2.3 GHz, we *really*
need some activity up there, and I've got a bunch of commercial
surplus dishes I'd like to unload. :-)

Gee, you must be disappointed a lot. I've never seen a flawless product, especially not one that contains software. They all have bugs or other problems of design or execution. You look for the best you can find, try to fix what you can, and learn to live with the rest. You get lots fewer ulcers that way.

Only you can determine when you get a dollar of value for a dollar spent, but with your expectations I doubt you are often satisfied. Even if you added a couple more zeros to AEA's price, I expect there would still be a bug or two lurking in there somewhere. Even billion dollar spacecraft have defects. Any complex product does. The notion of "zero defects" is absurd, as NASA discovered.

6265. AEA Fax III Decoder Programming

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-29 00:00:00 UTC
From: dayglo@radix.net
Message-ID: <57nghp$8vt@news1.radix.net>
Source record: 33265
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.scanner

I would like to be able to code my own software for the AEA Fax III. I was wondering the following:

Did AEA or anyone else sell a set of libraries for the hardware?
Did AEA or anyone else sell programming documentation for the hardware?
Does anyone know the data's format?

Any help would be appreciated. E-mail to dayglo@radix.net.

Encryption=encipher look it up.

A Code is a replacement system: ARCHON = I am fine, home soon.
10-4 = OK, Code 3 = With lights and siren, ARL 73 = Best regards,
Of these, the first is a private code, designed to obscure the
message.

A cipher is the replacement of one letter or symbol for another:

Guvf vf n EBG-13 Pvcure.

Modern cryptograhy depends on large primes and random numbers to
generate ciphers that are very difficult to break. The output of a
good cipher appears to be random. The "perfect" cipher is a one-time
pad generated from a good random number generator.

It is these kinds of "codes and ciphers" that FCC prohibits.

PGP and PGP Phone are designed to "obscure" the content of the message
and are prohibited under Part 97.

The purpose of the "...intended to obscure communications..." is to
allow the use of encryption of aux. station control signals.

This is also the statement that allows the use of data compression
systems on digtal data... The intent is to compress the data, not to
obscure the data's meaning.

Simply IDing in the clear does not allow you to encrypt anything sent
via Amateur radio. You must also make available the encryption system
being used so that anyone, including the FCC, can monitor the
information content.

Take Care & 73

Lemme tell you one thing from out here in the wild west -- we had one
hellacious fire six months ago, and all the king's horses and all the
king's men could not communicate with each other for the first day of
the week-long fight. At all. It was ham radio, and only ham radio,
that gave them any and all communications from one unit to another on
the first day. And I think they are all well aware of it. Over the
next couple of days the BLM, Forest Service, local FD's, state agencies,
National Guard, etc. etc. eventually got it together to talk to one
another, but still all week we tied loose ends together by way of the
low usage repeater that my club maintains, not because we use it,
we don't much, but because there's nothing else out there.

I wonder if the family isn't in cahoots on this - Grandparents file
bankruptcy, Homeowner's insurance pays, Everyone profits.
Get a few crapola TV show appearances & a book.
Grandparents now live high on the hog in retirement.
Children inherit estate.

So they say, well, let's at least get something positive out of
the bad situation, eh?

Probably how a lawyer's mind works.

If I had to guess, based on no other information, I would guess that this is a scheme to get around the inheritance tax, which will tax a bequest from the grandparents to the kids or grandkids, at a confiscatory rate of 45% if they have a sizeable estate.

On the other hand, tort damages for physical injury are generally excluded from taxes. Therefore, the unfortunate injury to the daughter may be a vehicle for all concerned to avoid the inheritance tax. (Or it may not be; I'm only guessing).

Sounds like a clever scheme, by a clever lawyer. The kind of lawyer people pay good money for.

Packet is commonly used on these band, 300 baud is the maximum allowed
by the FCC for US hams. There is a lot of bbs bulletin forwarding going
on in the HF bands, QSOs are frustrating due to slow speeds and packet
collisions causing numerous retries.
There are several books available through the ARRL on the subject,
mostly entry level. The Radio Amateurs Handbook by the ARRL also covers
packet. You probably have similar books by the Dutch equivilant of the
Amateur Radio Relay League. Perhaps in the public library.

6279. Pocket Packet (Handheld) System For Sale

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-30 00:00:00 UTC
From: Steve Baer <kc7flp@ricochet.net>
Message-ID: <32A04E0E.154A@ricochet.net>
Source record: 33279

Pocket Packet System For Sale consisting of :

o Paccomm Pico Packet [VERY small, but no internal battery] (1200bps TNC-2 w/mailbox)
{Cost : $130}
o Sharp Wizard OZ-9520 512k Organizer/ASCII Terminal Emulator {Cost : $400}
[40/80 column x 16 line scrolling display, fits in shirt pocket]
o Wizard Spreadsheet Software (on IC Card)] {Cost : $30}
o Pre-made connectors for ICOM/Radio Shack HT's (used on IC-02AT) {Cost : $10}
o Belkin RS-232C Cable For Wizard-->Pico Packet {Cost : $50}
o AC Adaptor, Multi-voltage, for Pico Packet {Cost : $10}
o "Battery swap" fairly new ICOM BP-7 w/external connector for Pico Packet (you send your BP-7 or equivalent to me as replacement)
o Batteries for Wizard
o Manuals + 90-day warantee

$450 plus shipping in U.S.
$50 extra for BP-7 battery if not replaced

I'll be in the SF Bay area for another week if you'd like to see this unique setup, and after that back to Seattle. If you know much about handheld computers/PDAs, only the $500 units have built in terminal emulators for packet (Casio Cassiopeia 2MB @$499 or HP 200LX 1MB @499), so this is a real bargain. I've got almost $680 into this system with tax and it's less than a year old. Please e-mail directly to kc7flp@ricochet.net for a prompt reply.

Regulations vary in different countries. In the USA, we can use
packet on those bands, but only at 300 baud or less. We can use
1200 baud on 10 meters, up to 19.2 kb on 6m and 2m, up to 56 kb
on 1.33m and 70cm, and whatever will stay inside the band edges
above 70cm.

That's what the regulations say. Now what's practical is a different
matter. It is seldom *practical* to do even 300 baud on 80m. The
multipath fading is too severe. You really want to drop down to
about 50 baud symbols on 80m. On 40m and 20m, 300 baud will usually
work.

Note well, however, that baud is not necessarily the same thing
as bits per second. Baud is the symbol rate, but some modulations
we use assign more than one bit to a single symbol. This is called
symbol overloading, and can allow much higher data rates than simple
baud would indicate. Some more advanced digital codings also use
multiple carriers to effectively transmit symbols in parallel. This
also allows a reasonably high bps while still maintaining a low
baud.

6284. Re: Encryption of voice over amateur frequencies is Not legal

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-30 00:00:00 UTC
From: carl@ais.net
Message-ID: <57q8la$7vn@news2.ais.net>
Source record: 33284

In <32a02721.4444150@news.interport.net>, ccsys@interport.net writes:
>I haven't been able to find anything that specifies or implies that
>encryption of voice or data is illegal. The only reference I have
>seen to encryption is 97.113-a4 Prohibited transmissions which states:
>
>a. No amateur station shall transmit:
> 4. ... messages in codes or ciphers intended to obscure the
>meaning thereof, except as otherwise provided herein; ...
>
>If one were to identify in the clear, switch to encryption, QSO,
>switch to clear, identify in the clear I don't see how this would
>violate FCC rules. Keep in mind that encryption obscures the
>information NOT the meaning of it. Since one would not have done
>anything to obscure the meaning of anything they transmitted how would
>this be illegal?

If you use a code or cypher for the purpose of making your transmission unreadable, you have "obscured the meaning" and violated the rule ... there are some (limited) exceptions, like to secure command codes for controlling the ham satellites ...

>I believe what the FCC had in mind was to prohibit the use of 10-codes
>or "secret" codes. If one was to say "the eagle has landed" yet no
>eagle landed anywhere, but the phrase secretly meant something, then
>it should be a prohibited transmission. Obviously, the message was in
>a code or cipher intended to obscure the meaning thereof.

You mean like "Q-signals"? <grin> ... (only joking)

>
>My second argument is that if the FCC intended that there be no codes
>or ciphers at all why go on to add "intended to obscure the meaning
>thereof" when "messages in codes or ciphers" would cover everything?

There are many forms of coding which render messages unreadable to the casual observer, but which are intended for purposes other than to obscure meaning (like forward error correction, and the "scramblers" used in many digital modems to assure sufficient transitions in the data stream for clock recovery and DC balance ...) ... these have the effect of making things look like "jibberish", but that effect is not the intended effect, it is a side effect, secondary to the primary reason for using the code ... and these types of codes are NOT "cryptographically secure" in any sense ...

> >Also, in section
97.309-b RTTY and data emission codes regarding >digital transmission:

>
> b.Where authorized by ��97.305(c) and 97.307(f) of this Part, a
>station may transmit a RTTY or data emission using an unspecified
>digital code, except to a station in a country with which the United
>States does not have an agreement permitting the code to be used.
>RTTY and data emissions using unspecified digital codes must not be
>transmitted for the purpose of obscuring the meaning of any
>communication. When deemed necessary by an EIC to assure compliance
>with the FCC Rules, a station must:
>
>1.Cease the transmission using the unspecified digital code;
>2.Restrict transmissions of any digital code to the extent instructed;
>
>3.Maintain a record, convertible to the original information, of all
>digital communications transmitted.
>
>Have I missed anything? What's the consensus out there?

You are incorrect in some of your understandings coding vs. encryption
and how "cyphers" and cryptography differ from other coding schemes
which are designed for other purposes ...

Before someone accuses me of "flaming" you, I should state that this
does NOT make you a "bad person" ... it just means that you should be
encouraged to study coding techniques and encryption techniques a bit
more in order to gain a better understanding of the similarities and
differences between them ...

Joe,

AEA is not yet out of business. They are selling their inventory at reduced prices. I think they still have DSP-2232s available.

They do not consistantly answer the phone. They do answer all of their FAXes. FAX them at (206) 775-2340.

Hey Guys,

Why is this thread propigated to 29 different news groups? That is a horrible waste of spectrum.

Please Please dump all of the news groups from your replies except one. alt.ham-radio.digital-voice seems like the right place to me.

Please let this message be the last one to all 29 news groups.

There are two systems; Both have Macintosh computers, a TNC, a
DC power supply and a two-meter FM radio. Software and manuals are
included.

(1) $455.00
Mac Plus 2 Meg memory and built-in 40 meg hard drive
with keyboard and mouse.
AEA PK-232 MBX TNC unit
KDK 2033 (25 watts) 2 meter FM tranceiver
Azden DC power supply
All cables for direct plug-in

(2) $320.00
Mac Plus with 4 Meg of memory, with mouse and keyboard
MFJ 1270B TNC, with optional clock and memory
KDK 2016A 2-meter FM (15 watts??) tranceiver
EF Johnson DC power supply (Matches radio; makes a "base" for unit

The prices reflect US dollars, and do not include shipping.

Source record: 33290

hello

digital codes are legal over the amateur band. As written in
97.309(a) and 97.309(b) which refers to specified and unspecified coding.
I'm experimenting in a special coding system called PCM (PULSE CODE
MODULATION) which sends the voice signal over the radio in a digital
code. other unspecified coding systems is Spread Spectrum. coding is
legal to a point and are limited to ceeeertain bands S.S. (70CM) PCM
(33CM and above except 1.2 and 10.0 GHZ) codes are legal as longer as not
to obscure the meaning but being used to facilitate communication.

I can pretty much believe that. After reading those it makes me wish
I had a daughter so I could forbid her to marry a lawyer. :)

>>Why is it that when you tell a 'joke' about an Irishman it is called
>>tasteless; when you tell a joke about a black it is called racist, and
>>when you tell a joke about a lawyer it is called funny?

Even though you didn't post this, I missed the original response so here
goes:

The reason it's funny is because by and large most lawyers are lower
than slime.

>I dig into it.

There's the source code for the REQFIL server on the distribution disk.
A lot of people never find it because it is in SERVERS.ZIP which isn't
installed on to your hard disk. It's in VB, but there is a long comment
in it that explains what a server needs to do, irrespective of what
language you use. Unzip SERVERS.ZIP then read the file REQFIL.FRM in a
text editor and search for "Sub ServerAction" - the comment comes right
after it.

A lot of people in the UK have written servers, also some in VK - so a
packet message to WINPAC @ WW should produce a good response. (I'm
amazed at just how many servers there are available).

Finally, if all else fails, there's always me! :-)

Does anyone know where to find Commodore c-64 software.?

I have the MFJ modem card, but cannot find the software needed.
Any information on where to locate this software will be appreciated.

Don(AD4QQ)

Yes Don, I have the last Digicom Version ever written. Have both
the 64 and 128 versions which drive your card. I also use the
MFJ 1272 modem and am now awaiting a new one as I blew up the old
one when power supply blew its top. DL8MBT wrote the software with
2 other guys working together. Its absolutely more efficient than
anything Bill Gates ever wrote. Also the same authors that wrote
"digicom" software for CBM computers later on wrote the "pacom"
software for IBM and clones. Version 5 was the final upgrade.
Send me a disk , $1 postage, and your mailer with the stuff
copied off to you by return mail. If you just need the 64 version
1 disk should be enuff. If you want both 64/128 versions, then
4 sides or (2) 5.25" disks will be needed. I would prefer though
to use 3.5" 760K disks. One will handle all docs/and programs.

6297. The Firmware 2.7b English Docs?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-01 00:00:00 UTC
From: Roger Barker <roger@peaksys.demon.co.uk>
Message-ID: <VBrd4BAYvhoyEwD1@peaksys.demon.co.uk>
Source record: 33206

Does anyone know where I can find some English documentation for TF2.7b firmware? At the moment I have German docs and a sort-of-English translation for TFPCX, which has enabled me to understand most of the commands available.

The specific problem I have is that I want to know how to send binary data through it. Presumably there is some way to either put it in a true transparent mode, or to "escape" an Escape character? (Hope that makes sense!)

6299. packet-radio <=> internet <=> uucp mail gateway questions.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-01 00:00:00 UTC
From: "David A. Russell" <drussell@luminet.net>
Message-ID: <32A22109.32E98255@luminet.net>
Source record: 33208
Cross-posted to: comp.mail.sendmail,comp.os.linux.networking,comp.os.linux.setup,comp.mail.uucp,rec.radio.amateur.digital.misc

OK,
Here is what is going on here:

```
---------- ----------
| wormhole |----(UUCP)-----| luminet1 |
---------- ----------
/ \ |
/ \ |
/ \ |
(AX25) (UUCP) (SMTP)
/ \ |
/ \ |
*AX25 NET* *UUCP NET* *INTERNET*
```

That should be pretty easy to understand but just in case here is a key:

```
----------
| computer | (protocal) *network*
----------
```

luminet1 is a Sparc20 running Solaris (not sure what version exactly).
wormhole is a 386/33 running Linux Slackware 3.1 (kernel version 2.0.0).
Both are using sendmail (versions unknown... fairly new) for mail
handling.

I plan on making all the UUCP hosts have valid DNS entries (this could
be acomplished using MX records in the DNS databases right?). That way
the UUCP network and the Internet could appear as one. I plan on doing
this by having as many of the UUCP sites use uucp-dom as their mailer
type and those that don't I'll have a mailer-table entry to use
uucp-old. And the uucp-old machines can sendmail to
uucp!route!wormhole!user@internet.machine if they cannot figure out to
send something addressed like user@internet.machine to a machine that
knows what to do with it. In addition I could allow from the internet
side for mail to be sent to uucp!route!user@wormhole so that if they
don't have a valid DNS entry yet they could still receive mail. This
means that if my machine doesn't have an entry for an address in this
form user@machine in it's mailertable it should send it to luminet1 and
let luminet1 send it off as a smtp message accross the internet
otherwise it should send it off across the uucp network. That should be
a great way to handle that right? Any suggestions on how to improve
that? Lastly how would I go about allowing messages send to
uucp!route!user@wormhole and uucp!route!wormhole!user@internet.machine
to be properlly re-written and sent off?

Now the tricky part is adding the packet-radio network (which is more important than the uucp network right now). My understanding of packet-radio is that it has it's own mail protocals and the format of the send-to field is callsign@machine.location.country (or very similair). Now I looked at one such gateway and he had it set up to have a callsign for any user on the internet that wanted to recieve mail from the packet-radio network. They had a user like FAKECS@their.gateway.machine mapped to someuser@some.internet.machine. Is this because packet-radio mail will croke with callsigns that are longer than a certain limit and don't like anything except standard chars and nums? Or is just because of the legal restrictions? If it's because of the legal restrictions could I implement something like user%inet.machine@wormhole and look up to see if that machine is in a valid place to send without breaking laws (done either by looking up it's location with whois or somethin or using a file containing 'trusted' machines). From the internet side I'm sure I can do something like callsigne%packer.radio.machine@wormhole to send a message on the packet radio network from the internet. Again is this a good method to do this? Any suggestions? And again how would I rewrite the headers to properly do stuff liek callsign%packet.radio.machine@wormhole and the other way if it's possible. And if I need to use the callsign mapping to a user on an internet machine that's a standard feature of sendmail right? virtuser or mabe I just create a valid e-mail address and use the procmail .forward file ability?

Lastly is there a mail handler for the packet-radio network available for linux. If so what is it and where can I find it? If not what is the name of the protocal used and where can I find some information on it so that I can write up a mail handler myself.

Or am I just being a fool and should I just allow access into the machine via packet-radio but have the mail really only on the internet? So you can login to it like a packet-radio bbs but when you send mail it's to the internet and the internet can send to you but no real mail routing.

Sorry if any of the newsgroups I posted to are not suited for this message and sorry for the poor layout and formating of this letter.

Also please respond via e-mail in addition to the newsgroup as I don't have time to search through the newgroups.

Thanks,

David Russell

Source record: 33293

Hello,

Not sure if I have asked this request here before on whether
it was on another area??

Either way.............

What I am trying to track down is some form of software
that would allow, through the use of a soundblaster card,
the ability for one's 2m or 70cm (or any radio) to act as a
voice mail system, ie, through the use of DTMF a friend
(or enemy) could access your computer and leave messages
for you, and like wise you could leave messages for them, all
in a VOICE playback mode. Like a VOICE PMS.

If you know of any software that could do this, I would love
to hear from you

Thanks for your time in reading this.

bye for now

Mark

Hi.

Can anyone say me, how the BPQ packet switch share interupts with
an identical levels?

I defined a one virtual comport (COM7) from two real ports (COM2 and
COM4). But these real COM ports have an identical IRQ - 3 and BPQ
switch don't work correctly.

My BPQCFG.TXT file (port section):

```
TNCPORT
COM=7
ENDPORT

PORT
.
.
TYPE=ASYNC
PROTOCOL=KISS
IOADDR=2F8H
INTLEVEL=3
.
.
ENDPORT

PORT
.
.
TYPE=ASYNC
PROTOCOL=KISS
IOADDR=2E8H
INTLEVEL=3
.
.
ENDPORT
```

My equipment: PC 486DX 50MHz, 2 x MFJ-1270C in KISS mode,
Software: BPQ 4.08a, BPQHTNC2 driver.

>I thought AEA was gone!?!?!

As in affairs of the heart, gone does not necessarily mean forgotten!

:)

In the world of business, gone means different things to different people.

Not being an owner of AEA, and only from looking at the news, it appears that AEA's ownership has decided to quit doing active business with the product line. It appears that they still own the assets. That means there are still some completed units, partially completed units, a ton of parts for them, what ever stock of books, software disks and so on existed, or still exists as of this particular date.

These assets still have value. Therefore, the owners of them, will usually attempt to sell them, liquidate is a term you have, I am sure, seen before! This takes different forms. They wouldn't ordinarily hold a liquidation sale like MANY furniture stores you may have seen. They could make a deal to sell it ALL to a buyer that offers them an acceptable amount. They could sell it off in chunks, units to individuals and spare parts, books, software disks and design rights to a firm that might promise to attempt to keep the units in the field repaired and serviced, as best as possible.

They could make a deal with yet another party to go forward with software and firmware for the units that have been produced and sell the technology rights to that party, separately from any other move they make.

They could dedicate the technology rights they hold into the public domain so as to attempt to maintain the value of the hardware that has been built for those that invested with them.

All of these things take time.. Some of them can be influenced by whatever owners of the their products and rival product manufacturers do, together with whatever suppliers and others that may be owed money decide they think they have to do. If the matter winds up a subject for the United States Bankruptcy Court system, this road may take MANY different turns before we know the ultimate worth of owning an AEA product!

All humor is, more or less, based on insult. The safest public way to say this is to involve the SPCA. The opera ain't over until the canary sings..

:)

As the, at this point, happy owner of a PK88, PK900 and PK96 that all work very well for my uses, plus someone that is in business and has worked as a consultant for years in the CH11 game, lets hope the prinicpals of AEA do what most folks do...

They try to do the most good for the most people possible, given the water level they are swimming in....

:)

Having been around quite a few 100% payout CH11 cases and so on, I've noted that most business problems are not at all like personal problem cases. Business people, with some noteable exceptions, care much more for what happens to their clients than many individuals seem to care about their creditors, in my personal opinion.

I'll be tempted to bet that AEA does care about its supporters. Stick around...

Igor,

I have always used plug n play serial cards that you can
change the irq settings on. This makes it easier to use
bpq with numerous serial ports and different irq's so
that you won't get any conflicts with other comm ports.

6309. WINAPRS - Course and Speed

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-01 00:00:00 UTC
From: jminer@qed.net
Message-ID: <E1qxHM.72I@news2.new-york.net>
Source record: 33301

Hello,

I have used WINAPRS for tracking using a Garmin GPS and KPC-3. I have the KPC-3 Setup to TX all of the $GPGGA and $GPRMC data strings at certain intervals. The position and height (Alt) come up fine in the program, but the Course (Cse) and Speed (Spd) Do not under the Tracked Station List window. If I belive $GPGGA is for position and hieght (which I am reciving) and $GPRMC is for Position, course, and speed. Do I have to use different GPS Strings to recivie the Course and Speed or is there a bug in the program.

Thanks and 73,
Jon N2XFZ

While pressing the monitor button (below the lock switch), tuern the
tuning knob to get the auto or manual squelch settings. Not obvious,
but found this one while playing. Not enough settings in my opinion.

> Jim Hutchings VE5HM

Gee, good for you Jim! How much did he charge you?

Don't you ever wonder about the screwball laws being written everyday
to restrict and regulate our laws? Do you think they're written by
Joe Concerned Citizen?

How about the financial impact lawyers have on our everyday lives?
Every time they win some humongous settlement in some pea brained
case it ends up costing the taxpayers and consumers.

Ever look up justice in the dictionary? How about all those crooks and
murders that get off every year due to some "technicality"? Ever hear
of the case of the divorce where the mom was suicidal and mentally
unable to cope without anti-psychotic medication and the father was
"normal"...mom got custody.

The responses you see here are direct reflections of our own experiences
and disdain for lawyers. When one threatedned to sue me, I posted it
so the world could see what they are really like.

Sorry you don't agree that the world would be a safer and cheaper place
without them.

> as opposed to one of the other tors?
> Lee Mairs
> KM4YY

The chirping on Amtor signals is faster than Pactor. Most of the signals you hear on the band today is Pactor - Amtor seems to be on the way out. Clover and Pactor II stations tend to hang around .065 and the signals sound different with much longer transmit times, generally.

Good luck, 73, Bob (AA4PB)

6317. Our Purpose: Amateur Radio

Source record: 33217

On 29 Nov 1996 gary@ke4zv.atl.ga.us (Gary Coffman) wrote:
>You seem determined to downgrade our purpose of advancing the SOTA,
>first with arguments for public service and goodwill, and now with
>self-training. [....]

Not at all, Gary! Advancing the state of the art (SOTA) is a high purpose, maybe the highest for hams. It's the thing we as hams WANT to be known for more than anything else. Thousands of us like to try.

We tinker on this and that and have a lot of fun and learn a lot of things. But it's the very rare ham who actually comes up with something
beyond the SOTA and who documents it well enough for it to become part

of the SOTA.

And I applaud your comments about getting the rule changes to allow true frontier work. Moving in that direction will do much to improve our ability to push the SOTA. Such rule adjustment, by the way, appears
to be part of the "purpose" stated in Part 97.1(c). How's that for optimism? ;)

Let me try again to summarize.... All the purposes in Part 97.1 are still relevant, though some are becoming less relevant and are unconvincing. All are things we can POTENTIALLY make happen as individual hams. But the only thing we can CERTAINLY make happen as individuals is the development of our own personal technical skills,
thus increasing the pool of technical personnel.

I'm just trying to put these into a credible perspective. We're more likely to be successful with the political rule-making process you cite,
if we are completely credible.

I don't call this pessimism.

6319. Re: Where to get a list of RTTY Stations?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-02 00:00:00 UTC
From: "Paul N. Nix" <Paul_N_Nix@aud.alcatel.com>
Message-ID: <57v393$f9m@news01.aud.alcatel.com>
Source record: 33219

Tom:

In your posting you asked:

> Is there a current list of RTTY/AMTOR/SITOR,
> etc stations out there?

I presume you mean commercial stations ?

There are some 'guides' available, that list all manner of commercial stations (Gilfer Shortwave, and other concerns, carry them), but you may want to just try tuning around 8.4 and 10.3 MHz., to see what you find.

It is becoming quite difficult to find a plain RTTY transmission outside the ham bands. The only ones I've found lately were Spanish Language news bulletins. It seems like all the wire services, etc., have gone to various forms of encoded signals, such that your garden-variety RTTY decoder (like my old PK-232) doesn't know how to handle.

As far as finding a commercial source for SITOR (essentially the same thing as AMTOR), I frequently find one of AT&T's "High Seas" stations (think 'WOM') are on around 8.4 MHz, sending out weather reports in 'FEC' Mode.

If you're speaking of Amateur stations, try listening between 14.060 and 14.100 MHz, and also 7.040 to 7.080 MHz.

On 20 Meters, the AMTOR/PacTOR stations tend to be between 14.060 and 14.080 MHz, with RTTY between 14.080 and 14.100 MHz. I don't know what kind of 'standards' the Clover II, GTOR, and PacTOR II operators are keeping (I can't operate those modes)

Regards;

Paul Nix (WB5AGF)

Steve, Wi0e

6322. RXCLUS V6.4 available (DX-Cluster monitor pgm)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-02 00:00:00 UTC
From: rchalmas@iprolink.ch
Message-ID: <32a361d4.0@news.iprolink.ch>
Source record: 33222

```
*** Introducing RXCLUSter version 6.4 ***

### Languages: program: english, german, french, tchech, italian,
### polish, danish, dutch, spanish.
### documentation: english, german, french, italian.
### Author: HB9BZA @ HB9IAP, Robert (email: rchalmas@iprolink.ch).
### Date of the program: 01.12.1996.
### Category: freeware.
### Type of archive file : PKZIP archive (RXCLUS64.ZIP).
### Archive size: 167'098 bytes.
### Operating system: DOS (runs OK with OS/2 or Win95 in a DOS window).

*** WHAT THIS PROGRAM DOES ***

RXCLUS is a packet program for the DX'er and was specially designed to
receive and store the informations transmitted on the DX-Cluster network.
Connection to a cluster node is possible but not needed as RXCLUS can
extract DX, WWV and ANN informations sent to users on the monitored QRG or
exchanged between two PacketCluster nodes, and only those information will
appear on the DX screen.
RXCLUS also includes a DXCC database to record your worked and confirmed
countries in CW, SSB and RTTY modes and on the 160 to 6 m + satellite bands.
An audible and visible alert is issued when a DX spot announces a missing
country.

*** WHAT THIS PROGRAM DOES NOT ***

This program was not developed for intensive use on a BBS, that mean you can
connect to such a system, list messages, read mail and store it to the disk
but not (for example) make binary transfers nor connect to several stations
using different windows.

RXCLUS is a specialised packet and database program for the DX'er, NOT an
all purpose packet program !

*** MOST IMPORTANT FEATURES ***

- displays all frames or only DX-Cluster data
- stores the received DX and WWV spots into databases
- allows search in the DX database by DX call, band, comment or logger
- includes a personal database for the worked/confirmed DXCC countries
- issues a DX alert, which may include CW keying using the PC's loudspeaker,
if a spotted country is a new one on the mode or band
- give useful data about all DXCC countries (coordinates, ITU+WAZ zones,
local time, distance, azimuth, sunrise and sunset times).
- can use almost any TNC which can be connected to a serial port.
With the TFPCX interface, Baycom modems can also be used.
```

- 25 or 50 lines modes
- screen saver
- DOS shell
- allows translation in almost any language by the user
(see above for included languages).

*** WHAT's NEW IN THIS VERSION ***

- CW keying of the missing countries and bands (using the internal loudspeaker,
no sound card support at the moment)
- 50 lines mode (VGA only)
- use of separate windows for text input and received data in monitor mode
- quick recall of the last transmitted 10 commands (similar to DOSKEY)
- hotkeys for easy transmitting of up to 9 frequently used commands
- limited support of Clusse DX-Cluster system (only DX spots in connected
mode, beacons are not supported at the moment as their format is not easy
to use with the current structure of the program...)
- fixed a major bug making flow control useless and selection of 7 bits modes
impossible
- and the usual small bugs fixes...

*** GETTING RXCLUS ON THE INTERNET ***

The program is already available from my home page:

http://homepage.iprolink.ch/~rchalmas

Look at that page for links to other download sites, bug fixes,
new language files,...

It is also available from:

ftp://ftp.funet.fi/pub/ham/packet/terminal

*** GETTING RXCLUS ON DISK ***

RXCLUS can be received at any time from my address :

Robert CHALMAS, P.O.Box 1225, 1227 Carouge/GE, SWITZERLAND

Please enclose a self-addressed envelope and the following number of IRC's,
which includes postage and a 1.44 MB disk (other formats on request):

Europe and mediterranean countries
(first class mail) : 3
Overseas (second class mail) : 3
Overseas (first class mail) : 4

(One IRC less if you send a formatted disk).

Good DX and greetings from Geneva

Robert - HB9BZA @ HB9IAP email: rchalmas@iprolink.ch

> without them.
>
> de kg7fu
>
> The anti-gun control groups have a snappy slogan that basically says,
"guns don't cause crime any more than flys cause garbage". Without
debating the validity of that particular statement, I think that it's
unfair to blame lawyers for the state of our society. I'm not suggesting
that I agree with the strange things that go on in the "legal system"
(anyone collecting oxymorons??).
On the positive side of this topic, you might note that the Feds have now
decreed that aircraft manufacturers will only be liable for 18 years
after their product has been sold instead of eternity. Common sense does
prevail eventually.
Another point to consider is that many of these unbelievable judgements
have been rendered by juries!! Has the point been reached where we can
no longer trust the juries??
Our society has serious problems and sleazy lawyers are a symptom, not
the problem itself.
Honest, hardworking lawyers do exist and are a valuable commodity when
someone decides to rain on your parade. And yes, they're not
necessarily cheap, but most will try to keep costs down when they know
you're not well-off.

MSYS has the provision to password user access based on
a text file supplied by the user. There are a number of
utilities to access this file and allow the user to easily find
and send the password.

I have a number of users who utilize this feature due to the
same types of problems. I use it on check-ins using my
callsign.

> of lower transverter cost, IE the used MMT432 transverters we've been
> using on 70cm.

And where do you find those? I haven't seen any at local hamfests (and I've
been looking). Do they require conversion? Can you sell me one? Could
somebody design a cheap one just for ham applications?

OK, I see the hispeed packet page says they are $300 from Advanced Radio
Technology. Is that where you got yours?

> heavy overkill for a TNC. IMHO the digital interface card is the
> way to go, and is certainly cheapest. If you have a Mac, however,
> you can program the 8530 in its serial port to handle 56 kb, and

Yeah the PI2 is a bit more versatile a beast than we need for a
single 56K modem. I still think the modem should have a micro in it
which accepts kiss or 6-pack off a UART and emulates the 8530.
That way ordinary serial ports can be used for regular TNC's and the
56K modem too.

I was thinking such a setup could be the next big thing for the "herd" (as
you say) if sold all together as an off-the-shelf package for considerably
less than $1000. But the even higher speed stuff sounds tempting too;
it seems the cost is always $500-$1000 for the equipment, with the
resulting throughput being proportional to how much work you put into it.

> >Well, full duplex does not necessarily mean that the transmitters are

> >(what we normally do is to unkey the transmitter after a short idle
> >time, only to avoid a txdelay on every packet)
> >The design does not use AFC.

But it shouldn't preclude it. IMO the "hub" (what most users connect to)
should have AFC on the receive side, within some narrow limits (+/- a few
khz). That wouldn't preclude users' systems having AFC on the receive side
either. The dog only chases his tail if you adjust the transmit frequency
to match someone's receiver, on both ends, but the policy should instead
be to enforce channel size limits while allowing for the few-khz errors
that are hard to keep tweaked to perfection. Transmitters should always

be tweaked as acccurately as practical because they are the cause of
interference to other channels, but receivers could stand to show some mercy
JIC the transmitter is off a couple khz.

> >>>The S53MV 1.2 Mbit/s design looks nice, but there is no room in the

Where did you see that design?

> and a simple book compression scheme, we could support 6 million simultaneous
> 20 WPM equivalent QSOs in a 200 kHz segment of HF. Since that's 3 times as

I assume book compression means symbol lookup, like Huffman basically?

How does GMSK work?

Are you talking about using all 200khz at once and using digital multiplexing
methods or having 6 million RF channels in that space? The former would be
great for long-distance backbones but I think hams would miss the person-to-
person aspect of HF if this method were to hog most of the HF bandwidth
available.

BTW I was just thinking about the 10GHz data links again and wondering
how you even tune up a link operating that high. There aren't any spectrum
analyzers, counters, scopes or receivers that I can afford that work that high.
I guess you'd have to start with a very well-calibrated reference frequency
and mix down to a signal you can see with more conventional equipment.
Where would you get such a reference?

From: au@ix.netcom.com
Message-ID: <58040o$gq@dfw-ixnews11.ix.netcom.com>
Source record: 33226

After being on the receiving end of a fake message, why don't packet bbs's require passwords? I'm sure that using some of the higher ASCII characters would make it fairly secure.

>> simtel.net for some reason. Netscape keeps giving me "no DNS entry"

Let's settle this one for once and for all. The Simtel collection is
available all over the place and should be very well know:

"Simtel.Net : List of authorized FTP mirror sites

Simtel.Net, located at Walnut Creek CDROM, is the origin point of
Keith Petersen's world-wide distribution network for Shareware,
Freeware, and Public Domain programs for MS-DOS, Windows 3.x, and
Windows 95. It has more mirror sites than any other archive on the
Internet. Its web pages are also mirrored on many servers around the
world.

FTP.Simtel.Net is the name of the primary distribution site for these
collections. It is actually several ftp sites arranged in a rotating
pattern of IP addresses to help balance the load and to avoid access
problems due to network outages and simultaneous user limits. At the
present time ftp.ou.edu and oak.oakland.edu are the primary sites. Our
files are located in the /pub/simtelnet directory tree on these hosts.

The following sites are authorized mirrors of Simtel.Net as of the
revision date at the end of this document. This list will be
frequently updated as new sites are added.

Country URL (host and directory path)

Steve, I am please to hear your KAM+ works with the 450 in AFSK. You are
the first person to report success. I gave up messing with AFSK as there
were all kinds of floating grounds in the Kenwood connectors that caused
audio feedback.

> A friend's radios (he operates a number on HF,
> WA8BXN@WA8BXN.#NEOH.OH.USA.NA) work fine on AFSK, too.

I wonder if he was running a KAM or PK-232?
>
>
> Sounds to me like a problem with AEA.

Could be but they blamed Kenwood. Guess Kenwood wins as I understand
AEA is out of business.

Thanks John,
Yep, I was just checking. This 6.1 version has run under 2.1, 2.11, Warp,
Warp Connect, and now Merlin, without a hitch. Yes, TRUE multitasking
is terrific. I'm watching some of the locals yacking on packet on Com3,
I'm here on Com2 at 14.4, connected to a host system at 28.8 on Com1,
and developing a VBasic 4.0 doodad as another task. By the way, the
included Voice Recognition command software just blows 'em away when
they see it. "Computer!", "Ready!". I've got to do some serious playing
with that. See Ya.

Has anyone cracked open one of the PC data interface cables for the
Garmin GPS-45? Just curious if the unit would communicate directly with
a PC's serial port or if there is some type of interface (TTL?) that
buffers data to the PC... Anyone's comments/experiences would help..
Just trying to justify Garmins price for the cable.. Thanks in advance..

Jack, The data cable is just 4 wires, one for external power,one common
(gnd), data in,
data out. The data can be connected directly to serial port even though
it isn't
true RS232. I don't have my GP45 and notes with me as I write this, but
if you connect
to the site below you can find tons of info you seek. You could make up
some wires with
push-on connectors to attach to the socket pins instead of buying the
special cable.
There was a guy making up cables for free, but I think he got swamped
with orders
and stopped making them.

I hear about DVMS BBS which are used in Slovenia.
http://lois.kud-fp.si/hamradio/repeater.html

Seems DVMS is based on a voice chip and driver for FlexNet. BBSs be able
even exchage voice message's over fast Packet link.
DVMS is designed by DL9MHZ.

I also want to know more about this project.

Nope, anything you send over packet can be copied, doesn't matter if it's
ascii or encrypted (which isn't legal), so it's not possible, but yes, if
you want passwords that's doable, just not workable.

If you are using any Kantronics TNC, you can download the best, KaWin. Just
grab it from the KaWin Home Page, below. 73,

6347. STATIONS NOT ON NET

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-03 00:00:00 UTC
From: "Dr. Grant C. Richison" <grichiso@direct.ca>
Message-ID: <32A44A74.4D02@direct.ca>
Source record: 33240

Is there any way to listen to a radio station not on the net via computer? Is it possible, for example, to listen through a short-wave system, or ham? Is there some other way?

>radio stuff is still desirable over bogging the computer down with another
>process.

A single interrupt per packet is certainly less of a load on the PC
than an interrupt per character servicing the serial port connected
to the TNC.

>This is especially the case when stacking TNC's. A lot of us in this
>area have nodes on 145.01 - 145.09. Also, running a dumb terminal and a TNC is
>a lot cheaper than trying to get a pc good enough to run multiple processes.

I've found that dumb terminals are becoming scarce, but any old PC can
be used, and even an old 286 dragged out of a dumpster won't get bogged
down at 56 kb when it only has to service an interrupt per packet (PI card),
but it will bog if asked to handle faster than 19.2 kb on its serial port.
(You can fit 16550s and use polling loops, but that *does* bog the processor,
and if you have to service more than one port, you'll drop characters.)

When you run a TNC on a switch, your throughput suffers because the
TNC has to receive the whole packet, then send it to the PC over the
serial link, let the switch process it, then send it *again* over the
serial link to the same or another TNC. If those serial links aren't
several times as fast as the radio links, they contribute a serious
amount of throughput reduction to the system. Since you have to deal
with the serial port on an interrupt per character basis, that puts an
extreme load on the PC's interrupt handling (which isn't all that swift
to begin with). It's much better to bring the packet in under DMA and
then generate an interrupt telling the processor to process it. Then
spit it back out the same way.

A 386SX-20 can handle two PI cards, and that isn't much of a computer
by today's standards. My old 386DX33 running unix doesn't even breathe
hard handling a single PI card while processing news and supporting a
couple of terminal sessions. Newer machines like my 586-133 surely
aren't "bogged" down, even when servicing a PI card and the ethernet
card, running several X sessions, and playing Blue Oyster Cult on the

CDROM. And that machine cost less than the old 386DX33.

If you're using a TNC as a "node" (a quaint idea), where it doesn't
have to deal with a serial link, then that's Ok at very low speeds.
It quickly falls apart when you start to try to route reasonable
speed packets, however. The Z80, even an H with a 12 MHz clock,
just can't keep up. And code maintenance is a nightmare. Whereas
a PC is its own development platform, and is easily maintained.
And parts are available on every street corner for those times
when you need to repair the mountaintop switch on a weekend.

I just don't see much place for the TNC idea anymore. Baycom is
good enough for very slow packet (though that's bound to be very
soon superceded by just using the PC's sound card), and for fast
packet you need an internal card that can do DMA. That doesn't
leave much of a niche for a TNC. Perhaps in remote installations
where there is no room to mount a PC (remember that you don't need
to leave a keyboard or monitor at the site), a TNC might still have
a place for slow speed packet. And for those using laptops without
expansion slots, a TNC might still serve at 9.6 kb. But otherwise,
a direct PC interface is the way to go.

TNCs were a great idea 15 years ago, but the technology has passed
them by, network speeds are (or should be) way up from the 1200 baud
of a decade and a half ago, and computer power is dirt cheap. TNCs
are an obsolete idea today.

I'll go a little out on a limb and even say that DSP boxes are on
the verge of being obsolete today. Given multimedia PCs with sound
cards and plenty of processing power, there's little reason to buy
an expensive dedicated box to hang off the serial port, using the
very capable PC as if it were just a dumb terminal, when you've
already got all the processing power and interface you need right
in the PC. (Ok, you need top of the line PCs to approach dedicated
DSP boxes *today*, but in six months, or a year? Things are moving
very fast in this area.)

Source record: 33242

For a remote node a TNC is preferred to a PC. We have a number of sites up here which are difficult to get to in the winter. Another remote node in the network is solar powered, there is another compelling reason to use a stand alone low current TNC.

TNC's are not obsolete!

Ron

Hi All

Been using a pk232mbx for a while running WINPACK.

Now I would like to run the likes of SUPERPACKET which uses TFPCX style software. I used to run this setup with a BAYCOM board.

So what's the problem..... Well I cannot get the tnc to go into KISS or HOST mode. I have tried KISS ON etc.

The tnc has firmware version 7 installed.

So any help would be appreciated.

I too once needed a lawyer, and he came thru for me. I think the problem
is the
bottom half of the class. This lower 50% has contemp for the law, and
they are
who the lawyer joke are for. Basically, it is the Judges who have my
contemp, but
then they are lawyers also. And if you say, "What about the judge in my
case, where
I won", I will just say, at one point, the Judge fell asleep, and I won
in spite of him, mainly because of the strength of my lawyer.

>anything to obscure the meaning of anything they transmitted how would
>this be illegal?

You *are* attempting to obscure the meaning of the information by
using encryption, otherwise you'd just continue on in clear with
the message as you did with the ID (there's no reason to encrypt
digital voice *except* to obscure its meaning from anyone listening.
If no one except the receipient can extract the hidden information
from the cipher, it is intended to obsucre meaning and is forbidden.

What the FCC is saying is that the information must be readable by
anyone monitoring with the correct equipment and/or software. They
must not need to know a special secret key to break the cipher. It
has to be readily convertable back to plain text using only publicly
known methods available to anyone.

>I believe what the FCC had in mind was to prohibit the use of 10-codes
>or "secret" codes. If one was to say "the eagle has landed" yet no
>eagle landed anywhere, but the phrase secretly meant something, then
>it should be a prohibited transmission. Obviously, the message was in
>a code or cipher intended to obscure the meaning thereof.

"The eagle has landed" is an example of a secret code, and it is prohibited.
10 codes, Q codes, and other generally recognized codes are not prohibited
because their meaning is generally well known.

>My second argument is that if the FCC intended that there be no codes
>or ciphers at all why go on to add "intended to obscure the meaning
>thereof" when "messages in codes or ciphers" would cover everything?

Because *Morse* is a code, as are ASCII and Baudot (one could also
consider them substitution ciphers, but they are generally called
codes by the industry, so I will too). Those codes are not intended
to obscure meaning, however, they are to facilitate transmission,
and are widely and well known. If the FCC had adopted your language,
use of Morse, ASCII, or Baudot would be forbidden too.

We also use cipher machines. The data scramblers in the 9.6 kb and
56 kb modems are cipher machines. But their algorithms are public,
well known, and don't require a special key to decipher. They are
intended to *facilitate* transmission by spreading bit energy in
the spectrum and enhancing clock recovery. Thus they are permitted.
But under your proposed language, they would not be.

>Also, in section 97.309-b RTTY and data emission codes regarding
>digital transmission:
>
> b.Where authorized by ��97.305(c) and 97.307(f) of this Part, a
>station may transmit a RTTY or data emission using an unspecified

>States does not have an agreement permitting the code to be used.
>RTTY and data emissions using unspecified digital codes must not be
>transmitted for the purpose of obscuring the meaning of any
>communication. When deemed necessary by an EIC to assure compliance
>with the FCC Rules, a station must:
>
>1.Cease the transmission using the unspecified digital code;
>2.Restrict transmissions of any digital code to the extent instructed;
>
>3.Maintain a record, convertible to the original information, of all
>digital communications transmitted.
>
>Have I missed anything? What's the consensus out there?

What this is saying is that if you use a code or cipher other than
those which are generally recognized and openly decodable by any
listener with the proper hardware or software, you must use it only
to facilitate transmission, not with the intent to obscure the
information transmitted from any such listener, IE you are experimenting
with a new method to *facilitate* transmission, so the general listener
might not yet have the equipment or software to monitor it properly.
And you must keep a record of all such transmissions, and any information
necessary to convert them back to plain language, if the FCC has any
doubts about your intent and requests that you do so.

I'd say that any system that requires a "secret" key to decrypt
would fall automatically into the area of "intended to obscure
meaning", and would be automatically forbidden. For example, if

you encrypted a message with PGP using the public key of the
receipient, and it could thus only be decrypted by that person's
secret key, that would be forbidden because no one other than
that person could decrypt it (not even you).

OTOH, a PGP signature, which can be decrypted by anyone using your
published *public* key, would not fall into that area. It would
be used to facilitate verification *by anyone who happened to be
monitoring* that you are indeed the originator of the message, and
that's Ok.

>something beyond the SOTA and who documents it well enough for it
>to become part of the SOTA.

Sure, but that is true in professional as well as amateur circles.
True innovation is simply rare, no matter who does it, because the
atmosphere of free inquiry required for it to happen is rare, especially
in professional circles these days. That makes it all the more important
and precious when it does occur.

>And I applaud your comments about getting the rule changes to allow
>true frontier work. Moving in that direction will do much to improve
>our ability to push the SOTA. Such rule adjustment, by the way,
>appears to be part of the "purpose" stated in Part 97.1(c). How's
>that for optimism? ;)

Even better, look at this:

USC47/Ch5/Sec157/a (This is in the general provisions section of the
Communications Act of 1934, as amended, in the US code, and is the
ruling legislation for all FCC actions)

"It shall be the policy of the United States to encourage the provision
of new technologies and services to the public. Any person or party
(other than the Commission) who opposes a new technology or service
proposed to be permitted under this chapter shall have the burden to
demonstrate that such proposal is inconsistent with the public interest."

Section (b) then goes on to say the FCC has no more than 12 months from
the date of request for permission to exploit a new technology before it
must act on the request. Section 157 was added to the Communications Act
on December 8, 1982, and is binding on the FCC. So not only does 97.1(c)
of the Code of Federal Regulations require rules crafted to support
innovation, but the underlying federal law does as well. The FCC can

choose to ignore its own regulations when convienent, but it can't
legally ignore federal law.

>Let me try again to summarize.... All the purposes in Part 97.1 are
>still relevant, though some are becoming less relevant and are
>unconvincing. All are things we can POTENTIALLY make happen as
>individual hams. But the only thing we can CERTAINLY make happen

>
>I'm just trying to put these into a credible perspective. We're more
>likely to be successful with the political rule-making process you
>cite, if we are completely credible.

Well, as I said, we can certainly hang our hats on this. Amateur
radio has always been intended to serve as a reserve job training
program to a large extent. We just have to make sure we are training
in relevant areas.

Gary

You are, to some degree, correct.

The proliferation of lawsuits really isn't the fault of the Trial
Lawyers Association. In a sense, they are merely providing a service
to accomodate a demand for legal services in our country.

It is the desire to "get rich quick" (and sueing someone seems to
be a way of doing that with little to no risk if you can get a
lawyer to take your case on a percentage basis, which most will)
that the American people have today [inherently lazy bastards
they are -- the Japanese were right -- they want to lay around
with the good life, no work, have everything paid for them by
someone else -- basically an extension of the welfare-state
mentality that permeates this country today].

3B8 - From 20 November to 5 December Jacques, F6HMJ will be active
as 3B8/F6HMJ From 3B8CF QTH.
4K - Axel, DL6KVA (ex Y42DA) will be again active (CW only) from Vlad's
(4K9W) QTH in Azerbaijan.
5X - 5X4DLI (Dave, KE4EW) and 5X4DEL (Dale, N3BNA) are
now active from northwest Uganda, from the station of 5X4F (Paul).
QSL 5X4DLI via KE4EW, 5X4DEL via WB3DNA and 5X4F via K3SW. They
will join in a Multi/Single entry (using battery power) in the
CQWW-CW Contest as 5X4F. Look for them 37 kHz from the bottom of
the bands when possible.
6Y - JE3MAS will be QRV from Jamaica for the next two years as 6Y5XX.
C5 - Babs, DL7AFS, will be active from Gambia , December 2 to 15.
Callsign issued is C53CS.
C6 - From 3 to 19 December N6RA will be active as C6AHF.He
will participate in the ARRL 10 and 160 metres Contests. QSL via
home call
C6 - Walt (G3NYY/C6A) and Tim (G4VXE/C6A) will be active, mainly on CW,
from New Providence Island (NA-001) November 30 - December 9.
QSL info: G3NYY/C6A via home call; G4VXE/C6A via G3SWH. (Direct or
via bureau.)
CT - CT1AHU and others will be active from Santiago Fortress in Sesimbra
```

for the DFCP Award on December 7.It's ref. is F-037.
CX - In late November-early December Claudio, CX/LU7DW might be active
from Timoteo Dominguez island (SA-057).
active as HK3/IK4RSR (from Bogota) and HK0/IK4RSR from the islands
of
E3 - Jin, JF1IST, will be QRV from Eritreia on 1.824,3.790-796,7.040-
7.050,14.030,14.184,21.030,21.295Mhz.Callsign unkown at this time.
QSL via JH1AJT.
FK - FK8GM and FK8CR will be active as FK5M from Matthew Island(OC-???).
Eric and Eddy will be arriving to the island on 3 December (at
about 7 UTC or most likely at about 20 UTC) and they will stay
there till 20.00 UTC of 4 December. Operations are expected to
take place on SSB (3.790, 7.075, 14.195 & 14.260, 21.260 and
28.460 MHz), CW and RTTY. QSL via F6AJA.
FS - Members from the North Jersey DX Association will operate SSB and
CW as FS/W2QM on all bands from December 4 through 11. QSL via
W2QM.
HC - Bernd, DL1VJ/HC1OT will be active during the CQWW CW Contest.
HK0 - Pedro's (HK3JJH) operations from Serrana Bank & Roncador
Cays (NA-133) and Serranilla Bank Cays (NA-132), planned from 22
to 24 November [425DXN 285], have been cancelled.Maybe in late
December...
IOTA SA-017 >> Pedro plans to be active from this IOTA, dated to 6
7 December.Gorgona Isl. , possible call HK3JJH/5.
KC4_ant- Greg, WB7CHV/KC4 was recently active from a new Antarctic base that
is being set up at Siple Dome Station located on the Siple Coast
area (81.40S-149.00W). Greg is currently at McMurdo, but he
will be returning to Siple Dome in about two weeks for two days.
Another operator (Don) is there all the time, but it is not sure
how much operating he will do.
JD1_og - JA4GXS/JD1, JF4LNO/JD1 and JN4AWW/JD1 will be active from Chichi
Isl. (IOTA AS-031) , December 23 to 25.QSL via JA4GXS.
Also active from this Isl. JA8FCG/JD1 and JQ1SUO/JD1, December 16
to January 3 , 1997.
OZ_iota- From December 22 to January 3 , Ulli will active from Romo Island,
IOTA EU-125 , using the callsign OZ/DL2HEB/p.
PY_iota- Ed, PY6WL plans to be QRV from Abrolhos (IOTA SA-019) maybe this
week.
S7 - A group of UR operators is rumoured to be active as from 25
November from the five Seychelles IOTA groups with the call S79UDX.
QSL via UX0UN.
T9 - Dave, T9/WA5IKQ is active (SSB and CW) from 20 through 80 metres.
SP_ssh - Mark, SP3GVX should be active for one year from polish base "
Henryk Arctowski WABA SP-01" in the King George Isl. callsign
HF0POL.QSL via SP3FYM.
TM6 - IOTA EU-105, Batz Island will be active from January 10 to 12 ,
next year.The issued callsign is TM6BZ and QSL goes via F5SKJ.
Look around 7.060 , 14.260 , 21.260 only on SSB !
UA_iota- U1ZA/A is QRV Kil'din Isl , IOTA EU-082.
V3 - The following group will be active from Ambergris Caye,

Belize, from December 11-16th: Mike, W5ZPA (V31MP); Stan, W5JYK
(V31YK) and Wondy, K5KR (call pending). Activity will be on CW,
SSB, and RTTY.QSL to each home call with SASE.
VP8_fal- For the next two years Brian, ZD7BJ will be active from Falkland
using the callsign VP8CWN.
ZD7 - Johnny, ZD7WRG will be QRV on 80 and 40 meter SSB for the next
several months. QSL via WA2JUN.

=== * VUSHF * ===

CU7 - Marco (CU7BC) will be active from HM58 on six meters MS and ESP-E,
(50.110 Mhz).For schedules contact him at :
CU7BC@CT1EDY.CTAV.PRT.EU or email-me (etjfonte@ua.pt)

SB DXNEWS @ WW <CT1ENQ $NPDX.031W2
NPDXG Bulletin #31 [2/3]

NPDXG Bulletin (English Version) -> As you have noticed the English version
of our bulletin was not edited during some months due a lack of time , since
the last english bulletin, we received many messages asking for the bulletin
and we appriciated the concern from other DX'ers.
We have suffered some modifications in our club , and we have been more busy
making some other things to the Portuguese ham comunity ...
A Web page is being made for the NPDXG , for now only in Portuguese but we
plan to have it done in english very soon.
As you should now , NPDXG is the DX working group of A.R.U.A. (Aveiro Unive-
rsity RadioAmateur Association) but we have more working groups and not so
many members to do some much job ... Anyway we did many activities during
this time like the DXpedition to EU-150 (IOTA Contest) and last one to
EU-167 with two of our members , even some small expeditions to Portuguese
Islands.
We are also preparing the Most wanted Countries List for CT's 1996 that will
be published soon in our bulletin.
Our Packet DX Node has suffered some modifications and we have been
busy putting up a new 9k6 node to make a point to point link with our HF
gateway to European Packet Cluster Network.
In this number we made a compilation of some DX information from other
bulletins but we hope to keep receiving your informations for our bulletin.
Thanks everyone for support and we hope to make our best to the ham
comunity...

CQ2I IOTA EU-150 QSLs -> We have received the QSLs from the printer and we
can now start to reply all cards . QSL for CQ2I should go for CT1EEB and all
others via the Operators Home-QTH's.
North-American Stations can QSL via WA1ECA via Bureau or email.To know if
you're on the log send email to CT1EEB (ct1eeb@mail.telepac.pt) and give
the QTR,Freq,Mode,...

FT5 Info -> Eric, FT5ZG is already on the island but he won't be active
before February due to heavy work schedule. Also an important information :

HE HAS NOT BRING ANY MICROPHONE WITH HIM !!! Only a cw keyer...

So, unless somebody send him quickly one, he will only be active on CW with his R7 antenna... His qsl manager F5RQQ has moved, so do not use his adress just passed in all dx bulletins ; I'll get the new adress soon and print it in the packet network.

FT5WE+WF are going qrt on JANUARY and NOBODY will replace them for 1997 mission

FT5XL is going qrt on DECEMBER 10th 96 and NOBODY will replace him for 97 mission !

Pessegueiro Island Dxpedition 1996 -> Another NPDXG Dxpedition with two of our members CT1EEB and CT1CJJ plus WT2O , here's the story ... :

On November 17, 1996 we went to Pessegueiro Island EU-167 as this is a most wanted island for the IOTA program. Unfortunately we could not notify anyone in advance of the operation due to the fact that we were not sure if we could get transportation to the island or not. We were fortuate enough to find a fisherman willing to take us out to the island for the day.
The weather was beautiful for the trip out to the island and we arrived after a 45-minute boat ride. We set up the station on the top of the island, which has an old Portuguese fortress on the top, and proceeded to work as many people as we could in the amount of time that we had. The first QSO was at 1103Z with OZ5MJ and the last QSO was with G0KIK at 1502Z. We made 513 QSO's with six continents and concentrated on the areas where the island was the most wanted. We had to cut short the operation due to the weather changing for the worse. We departed the island at 1515Z and returned to Porto Covo at about 1605Z after a rough return trip. The seas had 2.5 meter waves, almost capsizing the boat but we had an experienced captain at the helm. We could not stay overnight because the island is a wildlife refuge and you need special permission to do so. In the winter this permission is impossible to obtain due to the changing weather.
But we did the best we could in the time that we had. We hope that you enjoyed working us for a new one and we really had a great time putting the island on the air. We made 513 QSO's in 4 hours using a TS50 and home-made vertical antenna.
QSL information is as follows:
CT1EEB/p via CT1EEB
CT1CJJ/p via CT1CJJ
CT1/WT2O/p via WT2O

See you from the next one! 73

>bbs's require passwords? I'm sure that using some of the higher ASCII
>characters would make it fairly secure.
>
>George N7BUI

George, everything you send to the BBS is in the clear. Any station
monitoring can copy a password and later spoof the BBS with it. So
passwords are basically useless.

There are other schemes which can be used over an unsecure channel.
The most popular is the challenge-response system. The BBS sends you
a challenge, and you respond based on information that only you and
the BBS sysop know. The same challenge is never repeated twice, so
eavesdroppers don't gain any advantage from copying your response
to the challenge. This is pretty secure, but it requires off-line
coordination with the sysop (who must be a trusted person because
he can forge messages from you). Once you are logged in, another
user can also "capture" the BBS by using a stronger signal, and
faking your ID in his packets. Thus he can still corrupt your
messages, but at least you should notice this is happening.

But the better way may be to digitally sign your messages with
a PGP authenticator. No one can forge this. It identifies you
uniquely, and also serves as a checksum to the message so anyone
can tell if the message has been altered after you sent it.

Gary

And how exactly will the soldering iron panacea help with the lack of promised firmware? Please restrict your answer to one (1) Blue Book.

Jerry

I've been interested for about 3 years! First I wrote a PI card driver
for OS/2 so JNOS could operate as an AX25 router for OS/2s tcpip.
I need 2 ethernet cards in the computer to allow OS/2 and JNOS to
communicate but it does work.

I really want to get an AX25 NDIS PI card driver so I can ditch JNOS.
I've receintly obtained a Developers Connection CD for LAN systems
which has a sample NDIS driver on it. It looks very complex. The next step
is to put AX25 and NDIS with the PI card driver. This isn't going to be easy.

Anyone familier with OS/2 NDIS drivers??? Anyone else want to write it?

6361. Running NOS ontop of BPQ

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-04 00:00:00 UTC
From: illmayerp@mail.dec.com
Message-ID: <32a35789.1267414@news.stl.dec.com>
Source record: 33161

Hello ALL

I am trying to get JNOS v1114x to work ontop of BPQ4.08a. I have compiled in the BPQ component of BPQ (into NOS) and I'm a little unsure how to set this up in the autoexec file.

I am able to get the packet drivers loaded for the ethernet card, no problems but what is the setup in NOS ?

The reason for BPQ is that I want to ECHO data from the NOS box to a second machine, running Winpack ontop of BPQ. The Winpack side is fine, no problems. Currently I've setup the echo in NOS to send data out of the second serial port and BPQ (on the Winpack machine) will pick us the kiss data via the serial link. My aim is to get the lot going via ethernet, if I can work out how to echo the data out on the ethernet port.

Any help would be appreciated... C'mon, it can't be THAT hard ?!?

Cheers..Pete..vk2yx

> switch don't work correctly.
>
> My BPQCFG.TXT file (port section):

Unless you are using a PS/2 system bpq will NOT share intrrupts on a
standard async port. The other exceptions are the drivers listed in
PORTS.DOC e.g. the quadram quadport.

As you are using the MFJ1270 which is TNC-2 compatible I would
recommend using BPQKISS eproms in both your TNC's one patched for
channel A the other patched or channel B, this way you can have (in
theory) up to 16 tnc's on one serial port. (see KISSROMS.DOC)

If you are stuck for EPROMs or you do not have a programmer let me
know by email, I may be able to help....

Good Luck !

The built in tcp/ip stack seems to work moderately well. At least it seems to over any practical links of 9600 baud and up. If your just farting around with old 1200 baud technology and logging into ancient bbses, just use any dumb terminal program.

I don't hink you are being fair here Jeff. While debugging an rf circuit is a skill one can learn with relative ease, real time debugging of DSP programing is a whole 'nother story.

Checking circuit boards for signal levels, dc voltages, etc is something that can be done easily. This was Heathkit's secrect to success. Not only did they tell you what to put where and when to solder it, they could give you a simple debugging guide, e.g. "if no signal at point a measure voltages at points b,c,d,e and look at this table."

With dsp code it's more like: play this recording through the system, looking at the values at locations 0x0060, 0x333 and register 2, when you have heard the transisitions at time points +0010123 and + 001111 ms relative to the start of each signal set. Then find the code that processed this data, double check your implementation of the fourier transforms and if you got it wrong, do it over again.

Then there is the more common situation of you got it right, but after traveling through the ether, the signal just doesn't look like it's supposed to and you gotta put a tiny patch into the code.....

And an ICE, a good disassembler, a logic analyzer with a *deep* FIFO,
an EPROM burner and a PLA programmer, etc. Just be sure to keep that
soldering *gun* well away from the unit. There's nothing inside that
can tolerate that kind of abuse.

You *can* reverse engineer the unit if it isn't too badly fried,
but it'll be a lot easier to do it now while it is working rather
than waiting for a custom ASIC or EPROM to fail. Of course if AEA
releases source, you won't need any of that, other than the burner
and PLA programmer.

From: baack@maine.edu
Message-ID: <584hj4$25ss@sol.caps.maine.edu>
Source record: 33168

Greetings all.
I have seen BBS's on the packet network have the ability to do callbook lookups.

Could I do this from my standard TNC? (KPC-3)
What do I need to do to set this up, so for example when soemone connects to my station they could enter cb n1rwy and get the correct information off a cd...

What do I need to do. ?

Thanks, Jason N1RWY

This is not true. BBS systems use an ASCII file. It can be 10 bytes
or 10k bytes in length. The BBS sends a series of numbers to the
person checking in. That person sends the character that corresponds
to the number sent.

Obviously the longer the file, the longer the protection will hold up.
In all cases the password files should be changed now and again.
I can't imagine someone carefully copying down password strings
but ...

Any of you packet types got any recommendations as to what new guys to
packet should go with. Kantronics was AEA biggest competitor at one
time, and they produced the "Kam plus" think it was called. My friend
just starting up wants recommendation for TNC that can handle both
VHF and HF ports at 1200 and 9600 baud as well as Amtor and Pactor.
Does the "kam +" do all this, or if not then does anybody make TNC
that offers all the above and not preparing to quit the business?.

I don't think you will ever get that to work. Why not put one port on
another IRQ? Unless you have a lot of hardware fitted, IRQ2 and IRQ5 can
often be used. If you COM ports cannot be jumpered for those IRQs, it is
usually easy to do it with a cut track and a link...

Hi Jack,
I've never cracked the case open, however the GPS-45 will communicate
circtly with a pc's serial port. No buffers needed.
I bought the Garman cable and that's all it is. wire with a
connector on one end(+ fuse holder).
And yes, the cable's over priced IMHO..

If you can find a good source for that connector, let us know...

I personally think that the best thing we could do was to give congress,
(etc.) 5 years to re-touch all of the laws to make them understandable
by the average product of our school system. It would be their choice as
to modifying the laws or improving the education system! ;o)

If it has been so poorly written that only a lawyer can read it, and two
lawyers come to different opinions of what it means, then it should not
be binding! (Think what that would do the the tax structure).

Hi Mike,
Although I have never tried experimenting with the baycom
modem, it looks tricky to experiment with. With a
TNC you can run many powerful terminal programs which
have scripting languages capable of automating many
tasks.

Stand alone(mobile) GPS trackers for APRS may also be messy
with the baycom, you'll need to keep a PC with you
where ever you go. (The GPS functions in the TNCs
are features I use often.)
TNCs as Ron mentioned, are a real plus if your running on
battery/solar/intermittant power.

But if you're running packet from home, and power
or experimentation, or portability, and where access to
the site are not issues, they seem great.
The Baycom was basically designed for a different type of use
thus having different strengths than TNCs.

I recommend picking the one best for your use and budget.

Ted...

```
attach bpq init 0x7f 50
^ ^--- bpq stream
|--- host mode interrupt

attach bpq 1 144
^ ^ -- port label
| ---- bpq radio port

attach bpq 2 432
attach bpq 3 node
etc. etc.
```

Don't forget to define a loopback port in BPQCFG.TXT (TYPE=INTERNAL)
in the PORTS section if you want nos to be able to talk to
the bpq node.

I think the guy who wrote the BPQNOS code deserves a big hand,
it used to be a real pain having to do it with the NODEDRV tsr and
packet drivers....

I can't help you with the ethernet bit but I'm sure someone else
reading this will....

Source record: 33185

Hans,

About a year ago I spent some time looking for a SSTV and/or fax program that would work with the 2232. AEA never released the information on the existing software interface, so none of the software suppliers I contacted were interested in expanding to include the 2232.. Oddly now that AEA is out of business some of this information my become available, but for now there is probably nothing. I hope I am wrong!

>part.

Ahem! Even a service oriented amateur should be expected to know how to
service the electronics he operates. That's especially true if an effort
has been made to make it modular plug and play. The idea is to have the
switches as standardized as we can make them. Base them on standard modules.
And keep ready to go spare modules for the network. So a site trip usually
takes no more than 1/2 an hour, during which the faulty module is located
and replaced. We have a couple of fellows who then repair the broken modules
and return them to the spares pool. (That's the theory anyway, sometimes
it doesn't work that way in practice.)

>>I consider effort how much of *my* time I have to spend to accomplish

>think it is enough is not very rewarding.

Oh, I agree. That's why we have a networking organization which funds our network. The networking organization, GRAPES, is made up of the user LANs (clubs) in the state. Each club sends two representatives as voting members of GRAPES (think of GRAPES as a club of clubs, there are no individual memberships), and also sends a check off from the dues of their members to GRAPES annually. GRAPES then funds, builds, operates, and maintains ownership of the network switches. (Of course selling 56 kb modem kits has also brought in funds to GRAPES, and part of that goes toward the network too.)

The LANs are responsible for any internal nodes in their LAN. GRAPES' responsibility stops at the 56 kb switch serving the LAN. And each LAN is responsible for any services, such as a BBS, that they want to provide their LAN. Different LANs handle that differently. One of our LANs owns their own BBS, others have LAN members authorized to provide BBS services as private efforts. Some of our LANs have rather complex internal networks, others don't. That's all under local control.

Basically, GRAPES fullfills the role of common carrier (ala AT&T Long Lines) for the regional operating companies (the Baby BelLs, or in this case, the LANs). There's a network access charge built into the individual "customer" bill in the form of the dues check off for members of each LAN. The only difference between our structure and the phone companies is that GRAPES is a flat rate carrier (and we tolerate freeloaders because as amateurs we can't legally supply communications for hire). As you might guess, a number of our founding members work for the phone companies or AT&T.

We do have ways of encouraging membership, of course. For example, we can program a switch to prepend "This packet repeated courtesy of GRAPES" to the head of each frame sent over the network by a non-member. Heh Heh. (We don't normally do this, but we can.)

>Unfortunately there is a lack of knowledge about the financial aspects
>of running the packet network in our country, and at the same time there
>is a (real or sysop-imagined) ban on discussing financial topics or asking
>for contributions on the BBS system.

Well, we have to be careful about that too. We can't conduct GRAPES business over the air. That was the hard part, going around the state putting on presentations and selling the idea of a networking organization like GRAPES. That took years of effort by some very dedicated folks. Today we hold GRAPES meetings at major hamfests in order to conduct our business. We also use the internet and the telephone to consult between meetings.

>Unfortunately, in our country there is a commission that decides upon

>and now I believe we don't have to anything to fear real soon.
>However, he is still managing the frequencies and when we want a license
>for unattended operation we are dependent on him.

That's bad. We have bandplans, of course. And they do have allowance for many modes, including ATV (and I'm personally a booster of ATV). But unless someone is actively *using* those allocations for the bandplanned purpose, we can "squat" on the frequencies for our own uses. Of course we're subject to being bumped if activity conforming to the bandplan arises, but that hasn't been a problem so far.

Most of our usage *does* conform to the bandplans because we want the protection of coordination, but we are free to wander outside the bandplan in cases where there is no conflicting activity (or formal regulatory limits as there are on the lower bands). Of course we aren't required to get separate licenses for *any* terrestrial stations we might erect here in the US, and coordination is voluntary, though it does confer some worthwhile benefits.

We also have sites which are difficult to access, summer or winter.
Having the ability to upload new code to them over the network and
restart them is a major plus we wouldn't have with an ordinary TNC.

Solar power is a better argument, if you're using a micropower TNC.
There are low power PCs now (palmtop and embedded processing types)
which draw about the same power as a micropower TNC (less than an
ordinary TNC2), but they usually don't support ISA slots and often
require considerable modification to allow external DMA. So the TNC
remains a viable off the shelf solution for low speeds in this special
case. But at reasonable speeds, the micropower TNC can't keep up, so
it is still non-viable. So you just put up another solar panel and
use a "green" PC.

Paolo, I don't know whether you are aware of it or not, but most DOS programs run very well under WIN95. I use KaGold here, and am very pleased with it's performance with WIN95.

Whether you are interested in KaGold or not, you might want to check out their web page, where they describe setting up their program (or any other DOS program, for that matter) for WIN95. It is at:
http://www.interflex.com/

Good luck!

My BBS software has provided a password facility for some time. It uses
a randomly-generated matrix of characters - the user is challenged
to enter three of those characters (the X and Y co-ordinates of the
characters within the matrix are supplied by the BBS and the user
replies with the correct characters). The password is only required
to be entered if the user wishes to send or kill a message. The
SysOp can turn the passwords on for an individual or all users.

Passwords are also exchanged between compatible BBSs and PMSs prior to
forwarding taking place.

If you're interested, have a look at http://www.btinternet.com/~nna.

6398. FIRST CLOVER JAMBOREE

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-06 00:00:00 UTC
From: Neal Campbell - ON9CNC <Neal.Campbell@ping.be>
Message-ID: <32A8177E.75F5@ping.be>
Source record: 33055

Announcing the First Clover Jamboree!!

What is it?
The Clover Jamboree is an event to stimulate the usage of Clover as well as meet new people who are using it! The Jamboree promotes as many contacts as possible on all HF bands. It is not a contest, so everyone will be a winner!

When is it?
0000z 25 January 1997 thru 2400z 26 January 1997

How do I participate?
Simple, work as many Clover stations on all HF bands!

How do I report my participation?
1. For each contact, record:
Callsign, Date, Time, Freq., Power, S/N of station worked, Phase of station worked.
2. Send a list of your contacts to: masa@rack.improvers.fi, or to a MBO (which we will specify later).
3. Of course, send any comments that you might like to make
4. Send anything to the IDRA reflector about the event.

What frequencies should I use?
We want Clover stations to spread out, but suggested starting frequencies are:
28065+-
24920+-
21065+-
18100+-
14065+-
10130+-
7035 +- or 7080+- (for stateside ops)
3580+-

Any other suggestions?
Yes! First of all, when working someone, try QSY'ing to another band. We want to hear clover signals everywhere!
Second of all, send QSLs for all of your contacts. Mark on the QSL card "CLOVER JAMBOREE" in big letters.

Where will I see the results?
We will publish some results in the May Digital Journal, and, of course, on the DJ webpage.

: *AX25 NET* *UUCP NET* *INTERNET*
```

G'day David,
I have a very similar setup running here. You will find that it is possible
to do what you want, but rather tricky.

The first step is to get you UUCP to luminet going first. Once you are happy
with this, you can proceed. The reason why people can mail to a UUCP node
from the internet is that your wormhole's address is MX'ed to luminet, this
is important to remember.

: Both are using sendmail (versions unknown... fairly new) for mail
: handling.
I use smail, which is a bit less flexible but easier to work with, within
reason. I have tried this with sendmail.

: I plan on making all the UUCP hosts have valid DNS entries (this could
: be acomplished using MX records in the DNS databases right?). That way
See above. You don't get a choice, unless the UUCP stuff is sent out as
being @luminet; but this severly limits you.

: packet-radio is that it has it's own mail protocals and the format of
: the send-to field is callsign@machine.location.country (or very
: similair). Now I looked at one such gateway and he had it set up to
You have to be careful with terminology here. Amateur Radio does already
run TCP/IP with its own class A network and domain names. So that means
I use the exact same sendmail program to mail to an amateur or to the
Internet. But, unfortunately, amateur radio also uses a rather clumsy
and cludgy protcol as well. For a name let's call it MBL/RLI.

Now you can gateway between the two, but it is using manual tables to do it.
A programs called TNOS and LBBS will do it. I prefer LBBS as it is smaller,
it is basically another deleivery agent. I am assuming you mean MBL/RLI
forwarding from now on.

: FAKECS@their.gateway.machine mapped to someuser@some.internet.machine.
This would be using a manually-created table. that did this mapping.

: 'trusted' machines). From the internet side I'm sure I can do something
: like callsigne%packer.radio.machine@wormhole to send a message on the
: packet radio network from the internet. Again is this a good method to
Be very careful with amateur radio host names. They have a lot of problems
and are incompatible with Internet ones. LBBS gets around this by appending
the pseudo domain nts, which acts like the UUCP pseudo domain.

: Or am I just being a fool and should I just allow access into the
: machine via packet-radio but have the mail really only on the internet?
: So you can login to it like a packet-radio bbs but when you send mail
: it's to the internet and the internet can send to you but no real mail
: routing.
The easiest way for you is to get all your amateur radio users to use
a TCP/IP program, even windows, and then setup a pop server for them.
That way when I mail fred@wormhole, there will a message for Fred when
he next fires up his popclient.

If your users say "TCP/IP is way to scary, we want to use a dumb terminal
and a TNC, because that is the only way" (or something similiar) so that
they want to do a plain vanilla AX.25 connection, then have a look at
axshell.

Now if you want to forward to a MBL/RLI BBS, you're asking for a lot of trouble.
I know this as I have been doing a similar project to your own. Manual table
translation is the only way. You could do it via sendmails translation
facility, but like everything else in sendmail, it is hard to do.

Finally, if you want to play amateur radio and Linux, may I suggest you
subscribe to the linux-hams email list? This sort of thing is what it is
for.

The 1.1.9 eprom is available from TAPR:

Tucson Amateur Packet Radio
8789-309 E. Tanque Verde Rd. #337
Tucson, AZ 85749-9399

http://www.tapr.org

FAX 1-817-566-2544

Price is $15.00 (U.S.) plus shipping (a commands booklet is included).

The image file for version 1.1.8a is available for download from
ftp.tapr.org in /tapr/software_lib/tnc/eproms.exe. The 1.1.9 image is
not available at this time.

It might be possible with a crystal controlled HT or one of the early synthesized models which used an offset oscillator with direct f.m. for transmitting, like the IC02 or Tempo S-1. You only need about 3 kHz deviation, which depends on how hard you drive the radio. The i.f. on these beasts is probably fairly wide and it is should be easy to locate the proper point to insert/extract audio.

6403. CQ CQ > 80 Meter G-tor/Pactor Mode - 3639.00 KHz

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-06 00:00:00 UTC
From: "Patricia E. Gibbons" <wa6ube@ix.netcom.com>
Message-ID: <32A8CAFD.10B7@ix.netcom.com>
Source record: 33060

I am currently active on 80 meters with a Kantronics Kam+ with version
8.0
firmware and KaGold version 9.x

If anyone is looking for keyboard-to-keyboard activity on the 80 meter
band, try this:
a: set your mark tone = 1000 Hz
b: set space tone = 1200 Hz
c: set shift = modem

dial up your HF rig to a suppressed carrier freq of: 3639.00 KHz, Lower
Sideband
and try a connect with my station. I have been generating a little more
activity
on 80 meters by just being persistant and letting the rig call robot
CQ's in
TOR mode. This allows the station calling me to use either Pactor or
G-tor. My
KAM will autodetect which mode and switch accordingly..

If I am NOT around, I am leaving my ARQBBS = On.

If you connect in this case, you will get routed to my PBBS mailbox.
My 2-meter port is on 145.03 in the South-Bay/ San Jose Area and
messages left on my mailbox can be retrieved via HF Gtor/Pactor
or on VHF Packet..

Cheers! =:-o

Hello to All,

I've heard that there exists an EPROM for TNC-2C which contains Net-Node Software which makes it possible to build DIGIS with TNC and Transceiver only.
Can anybody tell me from where to get such an EPROM or, much preferably, from where one can download the contents of than EPROM ?
If YES, is there also a manual for that Software ?

Greetings

Alexander Ackermann

>-be

The only problem with WIN95 is setting up the STUPID routing tables !!
It doesn't like subnet masks of 44.255.255.255. I had to end up
setting up a little DOS batch file to update the routing table every
time I booted the machine. At least on NT workstation, you can
PERMANENTLY add a route.

I ended up running Winpack/FreeAgent/Pegmail/Netscape/Ws_ftp on a
WFW3.11 machine connected to a NOS router (386) via ethernet. I can
then connect to ax25 bbs's via Winpack and connect to ampr.org systems
via nos (ws_ftp, pegmail, netscape, telnet clients), basically best of
both worlds or is that worst of both worlds...

6407. SbFFT1.2 SB16 spectrum & filtering - BETTER GRAPHICS SUPPORT

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-06 00:00:00 UTC
From: kevinm@eden.com
Message-ID: <5884nr$1s5$2@boris.eden.com>
Source record: 33198

I have uploaded to Simtel.Net:

http://www.simtel.net/pub/simtelnet/msdos/hamradio/sbfft12.zip
ftp://ftp.simtel.net/pub/simtelnet/msdos/hamradio/sbfft12.zip 1558410 bytes

sbfft12.zip Sound Blaster spectral display & filtering

Features:
* Sound Blaster 16 (or 100% compatible) input and output.
* Band widths of 2K, 4K, 8K or 16K Hz.
* Spectral resolutions of 1 Hz to 16 Hz per pixel.
* Display of power spectral density with any of 4 color maps in either
linear or logarithmic scale.
* Define and use up to six filters simultaneously -- band pass, band
stop, low pass, and high pass. Filters have 25 Hz skirts at 3 to 50
dB points.
* Filters are defined graphically by mouse movement based upon the
displayed spectrum. Once you see a signal, you can quickly define a
pass or stop filter around the signal by clicking and dragging the
mouse.
* Net filter passband is displayed at all times.
* Filters can be selectively enabled and disabled by a single keystroke
or mouse click.

Special requirements: DOS 3.0 or higher, SB16 or 100% compatible, SVGA,
VESA 640x480 & 1024x768, mouse, 486/66 or higher to display spectra,
Pentium 120 or higher to filter.

Changes: Differences from version 1.1:
* Compatible with many more graphics cards.
* Full screen mouse support with faster response at high resolutions.
* Mouse click to enable/disable and delete filters.
* Defaults are assumed for the Blaster environment variable.
* Support for PCX graphics files instead of TIFF.

In addition to packet, on HF there are a variety of related modes:
traditional RTTY encoding with computers instead of machines, AMTOR,
PACTOR, CLOVER, and some others.

On HF where fading and QRM are more likely than on VHF/UHF expecting a
packet of 100 chars to be received w/o error and retry the whole packet
as needed makes the through put very slow. The other modes have various
ways of dealing with conditions. RTTY expects the operator to read the message
and if it doesn't make sense, ask the other op for a repeat. The others
have a variety of automatic error detect and correct mechanisms.

True. Or perhaps even capture your session, given FM "capture"
effect. Someone with better radio background than mine can think
about this.

>But the better way may be to digitally sign your messages with

Secure distribution of public keys can still be an issue, but
digital signatures are a very powerful method of authenticating
the originator.

Message-ID: <32A90F72.745D@digikey.com>
Source record: 33069

Experimentally I find that the MFJ1270C TNC2 works with an input audio level of from 50mv to 1000mv RMS, in the 1200 baud 1200hz/2200hz mode. However it seems likely that there may be an optimum level which experiences the lowest error rates. Anyone know? Surprisingly, or maybe not surprisingly, the MFJ manual is mute on the entire subject. At this time I have chosen to standardize the Micors at 300 mv RMS but I am interested to know if your experience suggests differently.

Baycom is a TNC in software that will turn your computer into a TNC,
if you build the Ramsey packet modem kit the software is included and
all for about $50. I have been using it on 2m and it does a decent job.

Of course you need a pc and a radio, neither of which is cheap!

6420. 1200 baud FSK demodulation in software

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-07 00:00:00 UTC
From: ethan@cs.wisc.edu
Message-ID: <58b7n2$26ru@news.doit.wisc.edu>
Source record: 33071
Cross-posted to: comp.dsp,rec.radio.amateur.digital.misc

For a project I am currently working on, I need to decode caller-id signals. The caller-id is encoded using 1200 baud FSK, with 1200 HZ indicating a mark and 2200 HZ indicating a space. This is the same Bell 202 format that is frequently used for packet radio.

Most of my experience is with low-level sound hardware programming, so much of DSP theory is beyond me. I'm working on Steiglitz's DSP Primer, but it's taking a while and I need to get this done quickly.

I am sampling using a PC sound card at 22khz with eight bit samples. The sampling rate is ten times the higher frequency, so it should be more than enough to avoid any information loss.

I have developed a method that works fairly well, but it still fails enough that it can't be used. The decoded data is recognizable, and around 75% of the bytes are correct (the others have a few bits wrong), but that's not good enough.

I'll explain my algorithm, then detail some of the problems I'm having with it and some of the ideas I've had about how to improve it.

The data is preceded by a hundred milliseconds of 1200 HZ carrier. I synchronize on the zero-crossings in order to find the starting point and length of the time period. When I reach the end of this, I then begin to decode the data.

First, I run the data through my demodulation filter. This consists of two band-reject filters, one at 1200 HZ and one at 2200 HZ. The filters are implemented by adding to each sample the average of the PI advanced and PI precessed (?) samples. Since the two quantities are 180 degrees out of phase, tones at the target frequeny cancel out, leaving only the other frequency. I originally used only the sample 180 degrees back, but I have found that using the advanced one as well reduces the number of errors made in decoding transition bits.

I then the absolute value of the output of each of these filters, and find the difference. Thus, one tone biases the output upwards, and the other biases it downwards. Here is the C code I use for the filter:

```
y[i] = + abs(x[i] + ((long)x[i-5]+x[i+5])/2) // 2200 reject 1 -> +
- abs(x[i] + ((long)x[i-9]+x[i+9])/2); // 1200 reject 0 -> -
```

I then sum the filtered signal over each time period. If it is above zero, then I treat it as a mark; otherwise, a space. Unforunately, there are cases in which the sum is zero, so this doesn't work. Long runs of a bit produces large positive or negative sums, but transitions from zero or one or vice versa result in values near zero that can be mistaken.

I have tried countless variations on this algorithm. Instead of using abs() in the filter, I have tried simulating a diode to use only the positive values from one and the negative values from the other. The schematic in the ARRL handbook does this, and I thought that it might improve decoding.

I also tried another method to reduce problems in transitions. Instead of simply summing over each time period, I tried applying a window, giving more weight to samples in the center of the period than samples at the edges (which are more influenced by the surrounding time periods).

I'm begining to worry that this method won't work, even with all the "improvements" I've made. I have heard of several other methods and experimented with some, but I'm reluctant to make a major time commitment in a completely new method without some idea that it works.

The first I've tried was mentioned in this group about a month ago. It involves multiplying each sample by a sample 90 degrees back. The discussion here didn't mention which frequency to use, so I used the center frequency of 1700 HZ (other frequencies just displace the output up or down). This has a similar effect to the previous method, biasing one tone up and the other down. Unfortunately, it doesn't give even as much separation as the other method.

Another solution that I just started experimenting with today is to differentiate the signal. This amplifies the 2200 HZ signal compared to the 1200 HZ one. I then sum the squares of the processed samples over the time period and choose some threshold as the border. I am reluctant to depend on amplitude at all, since the specifications make no guarantees about relative levels (the 2200 HZ tone is about 3/4 the level of the 1200 HZ one), but it might work if I can differentiate enough times (each differentation amplifies the high tone by a factor of two compared to the low one) before the signal is completely destroyed.

Two differentations is enough to get some recognizable data, but it isn't even as good as the two-filter method. I'm going to try it with more filters, but I need to adjust the level in between differentations. (to avoid overflows (actually underflows, as I'm not dividing by the sample period))

I just found another method mentioned, but I have been unable to try it out yet. It was posted in rec.radio.amateur.digital.misc back in September, but I didn't find it in my first Dejanews search a few weeks ago. It involves multiplying the signal x by a sine wave s and a cosine c, then finding the argument of the complex number sx + cxi, then looking at the derivative of that angle.

A final problem that I haven't yet discussed is synchronization. I currently find the time period for one bit of data by looking at the average period of the 100 ms carrier. Once the carrier is over, I use this synchronization (with fixed point to maintain the fractional part of the offset) until the end of the data. Since the FSK is phase-coherent, once the carrier is over, I know nothing about the phase of the data.

Although there are start and stop bits, I can't use the zero-crossings to resync, since I don't know where they will occur. During the carrier, the division between time periods corresponds with a negative-to-positive zero-crossing, but once there is a zero bit that has a different frequency (a space consists of a bit less than two full cycles of 2200, so the phase is shifted slightly), this timing is lost.

As far as I can figure out, there is no good way around this problem. Fortunately, the carrier is long enough that I can get enough timing info to hold synchronization for all the data (43 bytes; probably around 512 bits or so if you consider stat and stop bits and headers). The decoding doesn't get noticably worse from begining to end, so I'm guessing that any loss of timing is insignificant. However, I'd prefer to have some measure of syncing, just in case the messages get longer. Any suggestions? The only thing I can think of is to keep track of where the phase is expected to be by monitoring the demodulated data stream and predicting zero crossings based on the time spent at each frequency, but I worry that it would become unstable due to inaccuracies in sampling and cause even more problems that it solves.

Any solution has to run in real-time, using a small fraction of the CPU time, as it will run in the background in Windows. I'm sure this problem has been solved, as the modulation was designed to be easy to demodulate. There's a number of chips that do it, and they must work somehow (I'm not sure whether they do it analogly or digitally though).

I'd appreciate any suggestions on how to improve the techinques I'm currently using or on new techinques that would work better. Thanks in advance for any assistance,

Ethan Brodsky

6422. Micor Preamp - useful?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-07 00:00:00 UTC
From: Ron Stordahl <ron@digikey.com>
Message-ID: <32A9D6DC.491@digikey.com>
Source record: 33073

I am building up 3 110 watt VHF Micors for 3 remote nodes, each of which pushes the distance for reliable connections. It would seem obvious that these radios should employ the Motorola Micor standard preamp which offers 6-10 db of additional sensitivity. I am wondering if there is any downside to the addition of this device. It is an option, which most hams typically do not use, probably because it is unneeded in their particular installation as well as the fact that it is not inexpensive and a little bit rare. I do have them available to me however.

What is your experience with the preamp?

Ron N5IN

***EASY MONEY - FAST !!!!!

THIS IS THE FAIREST MOST WAY HONEST WAY I KNOW TO SHARE THE WEALTH !

Would you like to make thousands of dollars, quick, legally, with NO CATCH? then keep reading......please take 5 minutes to read this article it will change your life, just like it did mine.. it's true! you can make up to $50,000 in 4 - 6 weeks, maybe sooner!

I SWEAR I'M NOT LYING TO YOU.AND THIS IS NOT A SCAM! if your interested then keep reading;if your not, i apologize for wasting your time.

this is my second time i am doing this. the first time was 7 weeks ago and i have received $48,000. the first week i received $37 dollars,the second week i received $1,364 dollars and by end of the 3rd week i had received $12,856 dollars and to this date i have received $48,074 and money is still coming in.

when i first saw this article i though it was some kind of scam, but for $5 dollars and 5 stamps i thought i would give it a try.after buying a new car,new computer and putting a down payment on a house i relized this was the best $5 dollars i ever spent!

this process is very simple, and it consists of 3 easy steps:

(this whole process will take only a few hours of your time)

STEP 1: get 5 separate pieces of paper and write the following on each sheet of paper..."PLEASE PUT MY NAME ON YOUR MAILING LIST.YOU ARE NUMBER 4." get 5 $1 dollar bills and place one inside of each paper that you just wrote on,and fold each piece of paper so the bill will not be seen in the envolope (otherwise,nosey people who like to steal envolopes with money in it will get yours). put one paper inside the envolopes and seal it. do the same for all 5. you should now have 5 envolopes sealed,each

with a piece of paper and a $1 bill stuffed inside the paper.make sure those words that were stated above are stated on each paper. what you are doing is creating a service by this, this is PERFECTLY LEGAL. now then, mail the 5 envolopes with the paper and $1 dollar bill in each to the following addresses:

1. Dan Wood

1201 #A Anderson ST

San Clemente, CA 92672

2. S. Stapleton

6329 HWY 135 N.

Lake City, AR 72401

3. C. Crafton

1231 SW 61st Terr. #2

Gainesville, FL 32607

4. Michael Barratt

27 Park Ave

Poughkeepsie,NY 12603

5. Louie Page

2907 W. Gregory

Chicago, IL 60625

STEP 2: now take the first name off the list that you see above, move the other 4 names up (5 becoming 4 , 4 becoming 3 ect.)and put your name as number 5 on the list. you can slightly alter this article if you need to, editing what you need to edit.

STEP 3: post your amended article (with your name at number 5 of the list) to at least 200 newsgroups (i think there are 18,000 of them). all need is say, at least 200. HOW TO DO THIS: IF YOU HAVE NETSCAPE DO EXACTLY THE FOLLOWING:

1) click on any news group like normal,then click on "to news",which is on the far left when your in the newsgroups page. this will bring up a box to type a message in.

2) leave the newsgroup box like it is, change the subject box to something flashy like, "NEED CASH $$$" ,"READ HERE $$$" or "FAST CASH $$$!!.

3) tab once and you should be ready to type. now, retype (only once) this whole article,execpt to insert your name at #5, and remove #1 off the list, plus any other small changes you think you need to make, keep almost all of it the same.

4) when your done typing the whole article, click on file in this box, right above send, not where it says netscape news on the first box. click on "save as" when your under file. save your article as a text file to your c: or a: drive. do not send or post your article until you do this. once save move on to number 5 below.

5) if you still have all of your text, send or post to this newsgroup now by just clicking send, which is right below file, and right above Cc: .

6) here's where your going to post all 200. ok, click on any news group then click on "to news", again in the top left coner. leave the newsgroupss box alone again, put a flashy subject title in the subject box, hit tab once your in the body of the message, then click on "attachments", which is below the subject box. you will get another box to come up. click on "attach file" then find your file below that you have saved; click once on the file,and then click open' now click on ok; if you did this right , you should see your file name in the attachments box, and it will be shaded.

if you use explorer its just as easy.... holding down the left mouse button,highlight the article. then press "ctrl" key and the "c" key at the same time to copy this article. then print this article for your records to have the names of those you will be sending $1 bills to. next go to the news groups and press "post an article", a window will open. next go to the news groups and press "post an article" a window will open. type your headline in the subject area and then

click in the large window below. press "ctrl" and the "v" and the article will be placed in the window. if you want to edit the article do so and then highlight and copy it again.now everytime you post the article in a new newsgroup you only have to repeat "ctrl" and "v" and press post.

7) THATS IT. each time you do this , all you have to do is type in a different newsgroup,so that way, it posts to 200 different newsgroups ..you see? now you just have 199 to go!! (dont worry, each only takes about 30 seconds once you get the hang of it).REMEMBER 200 IS THE MINIMUM.

THE MORE YOU POST THE MORE MONEY YOU WILL RECEIVE !!!

AND THATS IT !!! THATS THE ONLY 3 STEPS THERE IS !!!

you are now in the mail order business and will start receiving your $1 envolopes from various people all over the world within days. hint: you may want to rent a po box eventually because of all the mail you will be receiving. JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT, PLEASE.

LET ME TELL YOU WHY THIS SYSTEM WORKS !!!!

out of every 200 postings, lets say i only receive 5 replies (which is actually very low!) so i made $5 dollars with my name at # 5.

now then,each person that just sent me $1 makes, say only 200 postings now with your name at #4, which is a total of 1000 postings,not including yours too. 50 people send you $1 now; thats $50.00 you just made! now, then your 50 agents post 200 each with your name at #3,or 10,000 postings (50x200). average return is 500 a $1 each is $500.

they make 200 postings, which is 5,000 returns at $1 each, which is $5,000 dollars! and finally, 5000 people make 200 postings which with your name at #1. you now get a return or $50,000 before your name drops off the list. and thats if everyone only makes 200 postings and if only 5 people respond !!!!

no like me when your name drops off the list just find the latest

posting and start over again..YOU WONT BE SORRY !!!!

I use BPQ with a 386 and F6FBB working for about 2 months.
I had problems with it too. I don't know about anyone else
but, I had to us different IRQ's for each com port.
Try using only one com port at first and then use the other
prot by itself too. If they work OK then you should reconfigure
your comm ports to use different IRQ's. I use an 8 bit card for
com 1 and 2 irq 3 and 4 and use a 16 bit card for com 3 irq 5.
I also use kantronics KPC2 kiss protocol.
Also make sure that you have the right IRQ matched to the
right comm port too, in the bpqcfg.txt
good luck de KB8LZG

Source record: 33080

Hi everyone!

I&#65533;m taking my tech test very soon now and I would like to get started on
Packet radio (2m + 70cm), maybe some SSTV later on.

I&#65533;m looking for a TNC which also has the capability to receive
wheater-fax, since I&#65533;m a member of a sailing club, but I would like to
start out cheap, say $200
max.
I live in a large city. What type of antenna should I get? A Groundplane
or a Yagi? One yagi I saw in an add has 10 dB forward gain, the other has
13.5 dB. Does it make a noticeable difference between the
two?

When I went shopping for a nice mobile I noticed that on many models
there is a 1200 and a 9600 bps port. Why is
that?

Well, thanks in adance

73, Patrick (no call yet) =:)

Any help would be appreciated on evaluating the use of an older Z80/CP/M based computer. I have the terminal units only, but have no storage device. the computer boots but cannot find it,s program. Do not know what kind of storage medium it would have had. I can see the connector on the backplane, looks like 7 pin header. Want to use these for RTTY possibly. Thanks, Steve Carlisle, VE7AHL

> and a little bit rare. I do have them available to me however.
>
> What is your experience with the preamp?

I have several VHF Micors in use, but I've decided against using the preamp.
All of my equipment is used at sites that have other radio equipment
on them. The preamp is added AHEAD of the 5 helical resonators in the
VHF Micor -- the preamp only adds two. On a site with some rf, you might
find that you need a cavity or two to clean up desense. Even without
the preamp, a few cavities are still needed to keep a couple
megawatts of rf out of a VHF Micor :-)

The best way to determine if a preamp can survive, is to go to the site,
install your equipment, and measure the desense with and without the
preamp when co-located transmitters are on-the-air. Generally, you'll know
right away...

Actually, both on packet and its various flavors like tcp/ip, the tnc or its substitute would have to believe it was connected before it could be used to override another station's signal. It's not impossible, it's even possible to produce a program to do so, but most imposter stations do so, because it's so easy to change the mycall parameters. Of course, I also point out that every government that I know of, frowns on such behavior by its licensees, and in the U.S., a ham is probably very likely to lose his or license for sending false signals if identified. Yes, bootlegging happens, but I would suggest that it's not quite as common or easy to do with even simple password measures. Nothing is foolproof except not sending out info, but digital signatures are indeed difficult to duplicate

some time back, I downloaded a .jpg or .gif of a very simple op amp circuit for an adapter that allows a standard serial port to read RTTY (I think there was a xmting version too, but I'm not sure). I plan to use Hamcom. The circuit used just a 741 and was extremely simple to build, and would work with Hamcom.

I've tried to find the URL, but no luck. Anyone know where I saw that?

>N2CBU

I read the bureaucratese as an attempt to limit the cases where secret messages will be sent without limiting the ability to experiment. Whether the bureaucrats have been successful or not I leave to the interpretation of others. It appears that if you can reproduce the clear text or clear voice upon demand by the regulatory agency, you are (pardon the pun) " in the clear".

I wouldn't think of asking the FCC for their interpretation for fear of a more limiting answer. However, dare anyone aske the "League" for their interpretation?

6449. X1J4 Question

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-08 00:00:00 UTC
From: Ron Stordahl <ron@digikey.com>
Message-ID: <32AB694A.2281@digikey.com>
Source record: 33100

I am using a MFJ1270C with TheNet X1J4 firmware at a remote site. It is not crosslinked to another TNC, thus the RS-232 plug is not in use. What I am seeing is that in the STATS list 'L1 flush' for port 1 is being incremented once every 10 minutes. If you will look at mode paramaters, which follow, you will see that the port 1 broadcast period is set at 600 seconds, i.e. 10 minutes. It appears that inspite of the fact that nothing is connected to the RS-232 port, and thus pin 23 is hopefully not asserted, the program is still attempting to send a nodes broadcase to port 1 every 10 minutes, resulting in a port flush, incrementing the 'L1 flush' once every 10 minutes.

I could of course set this timer to a high value (or maybe when set at zero it suppresses the port 1 nodes broadcast--I should have checked that for myself before sending this but...).

Those of you who know the internals of X1J4 may know exactly how this is supposed to work.

I am interested in knowing.

Thanks

Ron N5IN

This is your first problem. You should be using *bandpass* filters
and not band reject filters. With your technique, the output of each
filter is the opposite tone *plus* all the channel noise in the
telephone bandwidth. This severely degrades the SNR of your system
and can lead to many data errors. Use a pair of FIR or IIR filters
instead, configured as bandpass filters centered on each tone.
The output of each of these filters will be the desired tone *minus*
the opposite tone and *minus* channel noise outside the immediate
vicinity of the desired tone. This will yield a much better SNR,
and hence a much lower error rate.

(Implementing these filters involves multiply-accumulate operations
on the finite difference equation representing the desired impulse
response. See any DSP book for the appropriate algorithms. This is
really cookbook stuff. IIR filters are less costly in processor cycles
to implement, but you have to be careful in picking the coeficients
to maintain stability.)

Alternately, you could Fourier transform the data and pick the tones
directly off the frequency domain. This works well, but there are
complexities involved in splicing the FFT segments to get continous
response. This is usually covered in DSP cookbooks too.

In either case, you wind up with two data streams, M[i], S[i],
representing the two tones as the outputs of the two filters.

>I then the absolute value of the output of each of these filters, and find

>schematic in the ARRL handbook does this, and I thought that it might
>improve decoding.

The abs() function is the equivalent of fullwave rectification. But it
should be applied to the *outputs* of the bandpass filters, not summed
with the filters as you are doing it. The outputs of the abs() functions
should then feed lowpass envelope filters with a cutoff just above the
data rate. You can simulate this as the weighted average of a number
of samples, IE

M[i]=abs(M[i]) /*these are the envelope detected outputs of the tone filters
S[i]=-abs(S[i]) /* note that this stream has been set negative

Ym[i]=(a*M[i-1]+b*M[i]+a*M[i+1])/c /*these are the smoothed mark and space
Ys[i]=(a*S[i-1]+b*S[i]+a*S[i+1])/c /*note that Ys will be negative going

Adjust a, b, and c for the desired degree of smoothing. The value of a
should always be less than b. Good starting values might be a=0.5, b=1,
and c=2. More terms and more coefficients can be used for a better
response. (Caution, inappropriate choices of coefficients can create
unstable behavior, better filter equations exist, your mileage may
vary, etc.) The Y streams are then the smoothed envelopes for the
channels, and would be applied to the data slicer, or decision circuit,

to determine if a 1 or 0 is present.

Having the slicer adaptive, IE track the long term *average* of the sum of the outputs of the two lowpass envelope filters as a decision threshold will allow for some frequency error in the original bandpass filters, and for tone twist of the original signal.

(initialize Yslice to zero at the start of the program)

Yslice=(k*Yslice+Ym[i]+Ys[i])/3

Because Ys was set negative in the envelope detector, the long term average of Yslice should hover around zero. Tone twist or errors in the bandpass filter responses will bias Yslice so that it still remains at the median point between mark and space. Set k slightly less than 1 to insure a damped response. Now use the following as your slicer.

| for Ym[i]>Yslice, Data=1
Data=|
| for Ys[i]<Yslice, Data=0

You'll now have clean demodulated serial data. You still have to frame that up into characters, but now that you have clean data edges, simple clock recovery methods can be applied. Either a squaring loop or a Costas loop will do nicely for synchronous data. (A shock excited digital filter can also "ring" clock for you if the data stream doesn't persist for a long period, as in this case for Caller ID.) But since Caller ID uses async characters, a better clock can be generated with a 16x digital oscillator resynced by data transitions. This allows the clock to slip up to +/- 8 cycles per bit with no loss of synchronization.

>I also tried another method to reduce problems in transitions. Instead of
>simply summing over each time period, I tried applying a window, giving
>more weight to samples in the center of the period than samples at the
>edges (which are more influenced by the surrounding time periods).

Yeah, you have to do proper filtering. The problem is that you've been trying to do everything directly to the sampled tones. That doesn't work. Different time constants are needed at different points in the procedure. Your sample rate is several times above the Nyquist limit for the audio tones, which is good because it pushes the alias frequency far away, but you've got to have filters at the *data* rate too, and that's much lower. You can either add many terms to your difference equations, which can become computationally intense, or you can resample the recovered envelopes at a lower rate, say with a 16x bit clock. The latter is less computationally intense.

You appear to be attempting to "flywheel" such a clock from the zero crossings of the tone burst at the head of the data. That's not a great idea because you're using a reject instead of pass filter to capture that tone, the zero crossings are corrupted by channel noise,

and clock drift becomes a problem during message reception. You'd be much
better off using a digital PLL to recover a data clock.

>I'm begining to worry that this method won't work, even with all the

>separation as the other method.

Yeah, this is a digital discriminator. You need a hard limiter in
front of it to get any noise immunity. You can do that by multiplying
the samples by a large constant and running them through a clipping
function before feeding them to the discriminator. Then the output
will be strong and relatively clean.

>Another solution that I just started experimenting with today is to

>filters, but I need to adjust the level in between differentations. (to
>avoid overflows (actually underflows, as I'm not dividing by the sample
>period))

This method can recover *clock*, since it is responsive to edge
transitions, but it is not a suitable way to recover *data* unless
the data has been scrambled to equalize the number of transitions
and prevent long runs of 1s or 0s. A differentiator doesn't respond
to constant signals such as those represented by a run of 1s or 0s.

>I just found another method mentioned, but I have been unable to try

This is quadrature demodulation. It is very general and very powerful.
This method can produce the best results, but implementation issues
can be rather subtle.

Yeah, this is an *awful* method to recover bit timing. Again you are
trying to do too much directly on the raw tones. You want to synchronize
data clock with the transitions in the *demodulated* serial data stream,
not from the raw tones. Since you are guaranteed a start and stop bit for
each character, this becomes nearly trivial. Use a 16x clock, resynced by
each detected bit transition (the async format guarantees a transition at
each character start). This should have low enough drift to handle the
following character. The clock can slip up to +/- 8 cycles per data bit
without losing synchronization. In other words, you generate a freerunning
16x clock and sync lock it at each detected bit transition by adding 1 or
-1 to the clock's ring counter depending on whether the data transition is
early or late compared to the last clock transition, IE XOR data and clock
to produce a phase detector. Divide that locked 16x clock by 16 and use it
as your 1x bit clock on the serial data stream.

6451. FS: AEA DM-1 Deviation Meter

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-08 00:00:00 UTC
From: Joe Lanoue <jlanoue@timesmicrowave.com>
Message-ID: <32AB5CA8.2CED@timesmicrowave.com>
Source record: 33102

Have brand new (mint condition) AEA DM-1 deviation meter for sale.
Covers 144, 220, 440 MHz. Asking $125. Leave message or call
203-271-0027.

Best Regards...Joe

That adapter is detailed within the help file of the hamcomm program itself...its also given in the JVFAX program. The lil comparator also works with other software such as the pocsag pager decoder.

6453. Re: Micor Preamp - useful?

>and a little bit rare. I do have them available to me however.
>
>What is your experience with the preamp?

Preamp gain is relatively unimportant. What is important is the
noise figure of the preamp. It will set the noise figure of the
receiver, and hence how weak a signal the receiver can demodulate
successfully. FM receivers have gobs of gain, that's never a problem.
If the receiver already has a good noise figure, addition of a preamp
(at the receiver) doesn't do much good. If the feedline run is long,
adding a preamp *at the antenna* can be useful because otherwise
feedline loss directly degrades the receiving system noise figure.

The only way to tell if the preamp is helping is to do a SINAD
measurement. If the addition of the preamp allows you to achieve
12db SINAD at a lower input signal level, then it may be worthwhile.
If it doesn't make a difference, or makes things worse, then you
don't want to use it. And that's not the whole story, you also have
to test whether adding the preamp has harmed the third order intercept
of the receiver, and whether the site you're going to be putting it
will be usable at that intercept.

Now the Micor preamp does *not* have a significantly better noise
figure than the basic receiver in my experience. So it doesn't do
much good to add it to the receiver. In high RF areas, its extra
gain can actually be harmful because it can push a later receiver
stage into overload, and you'll suffer the desense and IMD that
can cause.

Because these radios are old, and device characteristics were
much more variable when they were built than today, I'd suggest
the only way you can know if your particular receiver can be
helped by your particular preamp is to test it. A SINAD measurement
will tell the tale. You don't care if a preamp raises limiter
current, you do care that it allows a better SNR of the demodulated
baseband signal.

Source record: 33105

Jon,

I have used it on a 9600 Baud link for my BBS. It worked great - much better than my modified Alinco DR-1200. The low TXDELAY makes a real difference on throughput at 9600 Baud.

The only real nuissance is the fat that it is rock bound. And there is no way to switch between a couple of channels. It only has one.

I have heard stories about intermod, but I used a filter (DCI), so it was never a problem for me.

6455. Re: Product Review of the TimeWave DSP-9+

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-09 00:00:00 UTC
From: Erik Skovgaard <Erik_Skovgaard@bc.sympatico.ca>
Message-ID: <01bbe58b$3cc244c0$57c56cce@default>
Source record: 33106

The quality of a DSP depends on what you are going to use it for. For CW, only, I'd probably go with a DSP-59 since it allows you to adjust both upper and lower cutoff frequency, however, for SSB the DSP-9+ is a vast step above no DSP, but the best I have ever tried is the JPS NIR-12. It seems to be able to elimiate most of the noise, you find around a big city.

Still, a good narrow IF filter is the best. THEN you can add audio DSP.

Ham Radio Online is now in its second year of continuous publication on the Internet. With readers in 53 countries around the world, Ham Radio Online is one of the world's most popular amateur radio web sites. Visit us at http://www.hamradio-online.com

We have feature stories added all the time, real-time radio propagation and aurora information, equipment specifications online, a huge library of past articles, current disaster situation reports, commercial products directory and one of the largest directories of Amateur Radio web sites on the net, plus an opinion section and a bulletin board where you can post your own messages.

Right now, wee have stories running on DXpeditions, African shortwave broadcasters planning to switch to digital satellites, Guatamala auctioning off the 70cm ham band to commercial users, news on AMSAT Phase 3D and AO-13's recent death, Global satellite navigation technology and so much more. We've got 20 new stories in the queue right now. Watch for them over the coming month or two.

In spite of our professional appearance, we run Ham Radio Online as a hobby. So please stop by and enjoy. If you have a story or announcement you would like to add, please pay us a visit and drop us some email to vbook@vbook.com.

Thanks and 73,

Ed (KF7VY) and Kim (N7VPL) Mitchell

6461. Problems with SPIRIT-2 TNC

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-09 00:00:00 UTC
From: chrnadig@iiic.ethz.ch
Message-ID: <58gq7j$5eq@rif1.iiic.ethz.ch>
Source record: 33112

Hi,

I recently bought two Spirit-2 Tnc, Model Backbone (20MHz) from Paccom. They
came with a small Monitor Test program burned into the EPROMS.
Neither TNC run eith this Monitor program, the STA and CON LED's were slowly
blinking randomly and on the TXD line of the RS-232 to the computer was a
continouing signal, never stopping. It seemed to be just a simple clock.

Then I tried it with the TAPR TNC-2 software version 1.1.8. The TNC's showed
the very same behavior.
The TNC's came with 70ns EPROM although there was dtated in the manual that
the backbone model needs 55ns. May this be the reason?

As both TNCs behave the same way I don't think it's a hardware damage.

Any Ideas?

Thanks a lot, Chris (HB9ZHK)

6462. North Carolina Packet Systems, by City - Dec. 96

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-09 00:00:00 UTC
From: kn4aq.gary@mms.net
Message-ID: <58h0f1$s8g@ralph.vnet.net>
Source record: 33113
Cross-posted to: rec.radio.amateur.digital.misc,triangle.radio

Packet>East
North Carolina Packet Systems List
Sorted by City
12/8/96

NOTE: The ARRL has decided NOT to publish packet information in
the Repeater Directory. TAPR is now considering how it might
fill in that gap, including a web site, CD, and print publication
of packet information. Stay tuned for details.

Packet>East meeting scheduled for Saturday, January 4th, in
Greenville.

Here's how to decode the "Type" column:

LAN = Local Area Network - basic user access node that
permits forwarding, probably connected to a BBS.
DXLAN = Technically just a LAN, but dedicated to forwarding
to a DX PacketCluster.
SEDAN LAN = Another Local Area Network, dedicated to the
SEDAN keyboard-to-keyboard network.
NOS LAN = A LAN dedicated to TCP/IP networking.
BBS = Full Service Bulletin Board, accessed directly on
the listed frequency.
DXPC = DX PacketCluster, accessed directly on the listed
frequency.
Backbone = used for forwarding traffic between LANs, BBSs,
DX PacketClusters, etc. Generally, users are
requested to not use the backbone nodes directly.

6463. North Carolina Packet Systems, by Frequency - Dec. 96

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-09 00:00:00 UTC
From: kn4aq.gary@mms.net
Message-ID: <58h0f4$s8g@ralph.vnet.net>
Source record: 33114

Packet>East
North Carolina Packet Systems List
Sorted by Frequency
12/8/96

NOTE: The ARRL has decided NOT to publish packet information in
the Repeater Directory. TAPR is now considering how it might
fill in that gap, including a web site, CD, and print publication
of packet information. Stay tuned for details.

Packet>East meeting scheduled for Saturday, January 4th, in
Greenville.

Here's how to decode the "Type" column:

LAN = Local Area Network - basic user access node that
permits forwarding, probably connected to a BBS.
DXLAN = Technically just a LAN, but dedicated to forwarding
to a DX PacketCluster.
SEDAN LAN = Another Local Area Network, dedicated to the
SEDAN keyboard-to-keyboard network.
NOS LAN = A LAN dedicated to TCP/IP networking.
BBS = Full Service Bulletin Board, accessed directly on
the listed frequency.
DXPC = DX PacketCluster, accessed directly on the listed
frequency.
Backbone = used for forwarding traffic between LANs, BBSs,
DX PacketClusters, etc. Generally, users are
requested to not use the backbone nodes directly.

6464. Re: Where to download Grapic Packet 2.0 ??

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-09 00:00:00 UTC
From: wranner@edu.uni-klu.ac.at
Message-ID: <58h0ca$5s7@newssrv.sci.uni-klu.ac.at>
Source record: 33115

```
In article <01bbe4e1$778fade0$c2f04fc1@default>, "Edgar Dijkhuizen"
<Edgar.Dijkhuizen@cbr.nl> says:
>
>I'm working now with Grapic Packet 1.61b.
>I hear some rumours that version 2 is available.
>Can anybody tell me where to download it??
>
>Thanks!!
```

Also heard this, but there is no such version of Graphic Packet.
Recently read a posting of the author of GP and he said that there's
a OS/2 Version, which is called 2.0 but has the same features as
1.61b. So this is the latest available version.

```
73s, Werner

The only "drawbacks" I see to this radio is it has only 5 watts TX
output and it is cystal controlled. Looks like it could be a good
choice though if you only need a packet mailbox. Also, it is capable
of 9600 baud, and is pretty re$onable.

Mike

I posted a similar message several days ago, Jon, but have yet to
receive any E-Mail replies and have seen nothing posted here.

I have also asked around locally and no one has any information.

Maybe someone knows about this rig!

Terry.
Part of your problem may be the way you are sharing the ports. Simply defining and jumpering 2 ports with the same settings probably won't work. It has to do with the way the IRQ logic works. The 2 IRQs have to be logically OR'd together on the card for this to work properly. Some cards such as the STB 4-com allow this, but most run of the mill 2 port and multi I/O cards don't.
I know of 2 BBS systems who are using this setup and it works just fine, however, I myself have not been able to make it work. Go figure!

That's probably because 44.255.255.255 is not a valid subnet
mask. Your subnet mask in most cases should simply be
255.255.255.0 in most AMPRnet configurations. If your really
interested in what subnet masks do and how they are applied
I suggest a good TCPIP text.

In article <32a9e321.10025097@news.abraxis.com> alexevon@abraxis.com (Alex Evonosky) writes:
> Anybody familair with the PacCom PTC-II DSP unit?
>any pro's, cons??
>Please let me know. Thank You.

It is the same unit sold directly by SCS. It is a very high performance HF system. But it has a very high performance price too. It works as well as people are saying that it does, but there aren't many of them in amateur hands (mainly I'd suggest because of the sticker shock). There are something like 250 amateurs in the world who have them last I heard. (A good proportion of them are reportedly going to non-amateur customers.)

I had a chance to use one for a couple of weeks, and I was very impressed. But I chose to buy the HAL P-38 instead. Clover allows quasi-duplex, which is useful to me because of a particular application I have, while PACTOR II doesn't. There are a good number of P-38s already in amateur hands (probably because of the much lower price, and HAL's running a Christmas special right now with a substantial discount off what I paid). And Clover performance is very good under most conditions, even if it is not equal to PACTOR II.

But if quasi-duplex isn't important to you, the sticker shock doesn't give you heart failure, and you'll be content to mostly use its lesser modes (which it also does very well) rather than PACTOR II (due to the relative lack of amateurs using that), then by all means get the PTC-II. It is the most advanced HF digital system currently on the market.

If it also had Clover and GTOR support, I'd swallow my discomfort with the price and buy one too. According to recent information, the PTC-II now has a generic audio DSP filtering capability in addition to its uses for digital data, so it can displace another box in the clutter on the desk. And packet capability is a promised future add-on (though that isn't very exciting to me, I've already got packet well covered).

It is *rumored* that it *will* support Clover in the future, and it may even support GTOR in the future, but neither of those are currently scheduled upgrades as far as I know. I've also heard rumors about a price reduction in the works, but who knows if that will happen or not. I'm watching it with interest, but I'm holding onto my money for a while to see if any of the rumored changes occur. Meanwhile the P-38 stays busy.

(Note, the firmware for both units is easily field upgradable, so I wouldn't be too concerned about rapid obsolescence. Both SCS and HAL have recently released free upgrades. I assume the SCS upgrade was

the addition of the generic audio DSP functions, and I know the
P-38 upgrade fixed some serious bugs in PACTOR I operation.)

>
>Thanks de wa1vht

Since you posted here, we'll assume you already have a computer.
(There are ways to do digital without one, but we'll skip that,
computers make everything more convienent and easy.) Two software
packages, with minimal hardware interfaces, will get you started
with RTTY, FAX, and 300/1200 baud Packet. Those are Hamcom and
Baycom. Hamcom uses a simple opamp zero crossing detector while
Baycom uses a single chip modem (just build these into a connector
shell). Other programs are available which use your computer's
sound card (if it has one) as the interface, so you don't have
to build anything. And some of them, such as the RiTTY 1.0 program
from Beazley, are very high performance.

You can also build a pretty high performance RTTY modem (called
a TU in RTTY speak) for very little money and effort. The old
Hoff design using 88mH toroids still works competitively compared
to most of the modern stuff if you update it with an opamp adaptive
slicer. It'll run rings around Hamcom and Baycom. Of course the HAL
and SCS DSP boxes do best, and handle many more (and more advanced)
modes, but that's getting out of the range of cheap entry level
equipment.

One of the best things about the more advanced digital modes is
that they can work at very marginal signal levels. This means
that your antenna and radio can be pretty simple and pretty low
performance. For HF, a dipole and a 50 watt transmitter will do
very nicely. For VHF, even a HT with rubber dummy load can be
pressed into service, though a better radio and antenna would be
more satisfactory.

For slow and medium speed VHF packet, a FM radio is required.
One of the best and cheapest sources of these is the commercial
2-way surplus market. A $50 Micor works just dandy. But just
about any FM radio you can find will do for 1200 baud. For
9600 baud you have to be *much* more selective. In general
if it is synthesized, avoid it. There are a couple of exceptions,
radios which do modulation at IF instead of in the PLL loop,
but in general you want a direct FM crystal controlled radio
for 9600 baud. The Micor mentioned above will work fine. Most

amateur market radios *will not* despite advertising hype of "9600 baud ready".

For RTTY, Packet, and the minimal TOR modes on HF, *any* HF transmitter will do. Even cruddy old CW only transmitters can be converted to FSK with the addition of a varactor or a switched capacitor in the oscillator tank. And any CW/SSB receiver will do, even a direct conversion receiver. Of course a good stable selective receiver will do *better* with any of these modes just as it will for anything else you might want to do. For more advanced modulations like Clover or PACTOR II, you need a SSB transmitter (but sticking with entry level, we'll ignore that for now).

Since most of the digital modes, aside from HF packet, are quite efficient, and perform well in marginal conditions, you don't need to run much power or have elaborate antenna systems. Of course those things can *help* in some cases, but they aren't mandatory. And, in general, the more you spend on capable digital modems, the less you have to spend on amplifiers and antennas.

For example, PACTOR II performance under harsh conditions is equivalent to adding a linear amplifier to your station for more mundane modes like OOK Morse (PACTOR II has at least a 10 db advantage over OOK Morse in harsh conditions, and an even greater advantage under better conditions). But that's straying toward the high end again and we want to stay with a minimal entry system here. (Just keep in mind this advantage later on when considering what portion of your station to upgrade first. IMHO the *last* thing you'll need is a linear. It will give you the least performance increase of anything you can do to upgrade your station.)

Note that HF packet is *the pits*. I suggest that you don't waste much effort with Bell 103 and AX25 at HF. AMTOR and PACTOR work much better (and Clover and PACTOR II work better still). Even old fashioned RTTY usually works better. Packet should work nicely at HF as it does at VHF, but we need different modems, modulations, and modified protocols to cope with the HF environment, and we don't have them in general circulation yet. A number of people are working on this. It is something to keep an eye on, but for now I wouldn't waste my time with HF packet.

I can't resist mentioning one UHF packet technology, the 56 kb WA4DSY (aka GRAPES) RF modem. These RF modems (they *are* the radio as well as the modem, just add a 10m->UHF transverter) are now available from PacComm and they are the most economical in terms of $$$ per BPS of any of the commonly used digital methods, IE it isn't dirt cheap, but it is very very fast. When

you are ready to step up from 1200 baud, you need to take a hard
look at stepping directly to 56 kb and avoiding the problematic
9600 baud choice. Of course as with anything packet above the
lowest common denominator, you have to get other locals to go
along. Talking to yourself isn't very interesting.

Jon,

There was a review of the unit in the April '96 issue of QST.

I think Buck Rogers K4ABT reviewed it in CQ a little before or a little
after the QST review.

What I'm more interested in is the putting signatures on packet messages.
In this case, the key of the owner of the message would be encrypted, but
the text would be clear.

Hams would register a public key in some kind of white pages database.
They'd tack on the PGP tail, and then any kind of internet gateway type
of device could verify the validity of the device and pass the message
to the packet network.

Honestly, though, would anyone really be hurt if internet email were
forwarded through packet. I think ham radio loses a lot for all the
paranoia that one of the dreaded 5 bad words goes through. It seems to
me like a little lightening up on the obscenity/business rules would
go a long way to breathing a bit of fresh air into the hobby.

I think it would be sufficient to provide a means and put in a good faith
effort to bounce email from sights that advertise or send pornography.
Rather than painstakingly insuring that only messages from ham radio operators
get out -- which seems overkill to me.

Source record: 33135

Hi, Just thought I'd throw my 2 cents in... I own one of these data radios and
it works pretty well. The sensitivity seems a little low but is adequate for my
needs. A word of caution though, changing crystals is not trivial, it requires
a realignment for which you need an accurate freq. counter, VHF RF source,
and an oscilloscope (optional). MFJ doesn't mention this in their ads, and
the alignment is quite tricky.

If you can leave it on 145.01 you will save yourself some grief.

The fifth annual TARA (Troy Amateur Radio Association) RTTY sprint is this coming weekend. A great way to warm up for the annual ARRL RTTY contest in January.

For details see the web page at http://generators.com/tara/rtty.html

Hope to see you all on the RTTY Sub-bands

51.7 seems to be a popular channel BUT with the recent rptr expansion, I wouldnt look at that freq....

With the way 6mtrs is now (three or more different bandplans for the FM section), noone knows where to operate...

I think I have also heard of 50.7 being mentioned.....but not sure of that...

As a proponent of a 1.6 Mhz offset on 6mtr FM, the plan also includes 1 Mhzz offset pairs for packets between 52.6-52.7 and 53.6-53.7 Mhz

I dont think any other rptr bandplan for 6 includes ANY channels set aside of packet operation...much less duplex...(but I could be wrong)

I have always thought 6 would be excellent for long haul backbone operation at speeds up to 9600 baud...with low band gear being CHEAP on the used market (my former company just got rid of all their lowband gear and went 800Mhz), and the distance 6mtr offers as reliable operation, it would be a good band to look at.

Jim, Before you lay out your hard earned cash I would investigate all
the
programs that are out there. There are several and all have thier own
merrits. I personally suggest XP-WIN by KF7XP ... he has a homepage
and you can download a demo which will allow you 100 uses before it will
no longer work. Its an excellent program that has all the features that
I enjoy. Great split screen and works under windows perfectly.

If you only use dos then try his XP-KAM. Its a KAM specific program and
has all the properties of XP-WIN only in DOS. A demo is also available
via his HOMEPAGE. As far as support I believe that Gary's is the best
of all. (and Ive tried em all) He is fast and efficient and is always
ready to listen.

Give it a try and good luck

I have two of these, and actually they do work well.

But don't put them on alignment equipment as you will discover that they drift about 1 KHz during a 1 second long packet! Fortunately the nodes you connect to likely will have sufficient bandwidth that they will not notice the transmit frequency instability.

I returned one of them to MFJ explaining the problem, they returned a new one to me which suffered from exactly the same problem. I concluded that they really didn't care to fix the problem, and since the unit does work I just dropped the issue.

Maybe the current product has been fixed as my experience was about one year ago.

>and can lead to many data errors. Use a pair of FIR or IIR filters
>instead, configured as bandpass filters centered on each tone.

I've tried this, with fairly bad results. I think the problem is that I only have one cycle at 1200 for mark and a little under two for space. Do filters work with only one cycle? I tried it using 9 and 17 sample band-pass filters. Should I use longer ones, even though that will overlap seriously with the previous sample? The band-reject filters I use only look at the samples at +-9 and +-5, but they seem to perform better than the FIR band-pass filters I've tried. (Designed using fir1() in matlab)

>...
>In either case, you wind up with two data streams, M[i], S[i],

>Ys[i]=(a*S[i-1]+b*S[i]+a*S[i+1])/c /*note that Ys will be negative going

How wide should I make this? I tried it using three and five samples, but I still don't get clearly defined patterns. If I were to average over the time periods predicted by my carrier synchronization it might work a little better than what I'm doing now (although it would be several times slower), but I couldn't use the syncronization method you mentioned below, because I'm not getting good edges.

>>> WRT: adaptive slicer

>the bandpass filter responses will bias Yslice so that it still
>remains at the median point between mark and space. Set k slightly
>less than 1 to insure a damped response. Now use the following as
>your slicer.

Will long consecutive strings of zero or one screw this up? I guess
the division by three fixes it, since it will decay rapidly when there
is a change.

> | for Ym[i]>Yslice, Data=1
>Data=|
> | for Ys[i]<Yslice, Data=0

I'm assuming it is acceptable to compare the sum of Ym[i] and Ys[i] to
Yslice rather than using the equation above, which can frequently return
Data equaling both zero and one.

>You'll now have clean demodulated serial data. You still have to

I'm not getting clean data... The original signal is very clean, so I
really shouldn't be having much of a problem. Is it because my filter is
too short, because my low-pass envelope filter is too narrow, or something
else?

>...

>Yeah, you have to do proper filtering. The problem is that you've been

>at a lower rate, say with a 16x bit clock. The latter is less computationally
>intense.

How does this 16x bit clock work? Do mean having 16 samples per bit?
Right now, there are 18 samples (22000/1200) per bit, so that's not much
of a difference. Would I be better off making the low-pass envelope
filter average over 18 samples?

>You appear to be attempting to "flywheel" such a clock from the
>zero crossings of the tone burst at the head of the data. That's
>not a great idea because you're using a reject instead of pass filter
>to capture that tone, the zero crossings are corrupted by channel noise,
>and clock drift becomes a problem during message reception. You'd be much
>better off using a digital PLL to recover a data clock.

actually, it synchronizes using the raw data. There are about 150
cycles of carrier. It divides the number of samples by the number
of cycles to find the average. I think this might be where the problem
is... It figures 18.37037 samples as an average time period, but

the actual period is either 18.375 or 18.518. I'm not sure which it
should be, as some sound cards round the sampling rate from 22050 HZ
to 22222 HZ, but it works almost perfectly when I chose 18.518.

>...

>data clock with the transitions in the *demodulated* serial data stream,

>early or late compared to the last clock transition, IE XOR data and clock
>to produce a phase detector. Divide that locked 16x clock by 16 and use it
>as your 1x bit clock on the serial data stream.

I still don't understand this too well... You're saying I should take
my processed datastream of zeros and ones and use a clock that advances
18 samples, then moves forward or back one depending on whether it is
behind or ahead of the transition. Then I would look at the sample
halfway between the endpoints of each time period (or the average over
the whole period for between reliability) and use it as the output data.
Is that what you are suggesting? The only problem I can see with it is
that my binary data-stream isn't clean enough. I'm going to try using
a longer (32 sample) filter and/or a longer (9 or 18) sample envelope
low-pass filter to see if that improves the situation.

I'm interested in what subnet you would then use here ? We have a
wfw3.11 machine, ip 44.136.15.15 that connets to another NOS box,
gateway 44.136.15.14. If we had a subnet mask of 255.255.255.0,
EVERYTHING that happens on the subnet would then go via the gateway
box. What the mask of 44.255.255.255 does is only send 44.xx.xx.xx
stuff to the gateway, the rest of the stuff then stays on the loacl
network.

When we had 255.255.255.0, every bit of JUNK that comes out of wfw3.11
goes out onto RF. They guy that I was with knows his TCP/IP stuff
pretty good BUT we're always welcome to suggestions !!

Source record: 33147

I've got a Motorola AP50 that I'd like to connect my TNC to. However, no one around here would sell me the connector I need (the 'Accessory Connector').

Can this darn thing be purchased from Motorola as a spare part or something? Would someone be so kind as to provide me a part number, and where I might purchase it? Also if you've got any idea how much a beast like that would cost?

If not, can it be improvised? Anyones got the dimensions of this connector? (The accessory connector for the AP50 is the same as the GP300 and others similar).

When I've found the connector or something thereabouts, anyone knows how I can connect it up to a) My baycom modem, b) a MFJ 1270C.

Email replies appericiated. Thanks.

Finally, does anyone know

>The TNC's came with 70ns EPROM although there was dtated in the manual that
>the backbone model needs 55ns. May this be the reason?

That looks likely. The reciprocal of 20 MHz is 50ns, so it would appear
that even 55ns depends on the EPROM being a little faster than spec.
They usually are. Temporarily jumper it for a lower clock and see if
it works. If it does, that'll tell you that there are no gross problems
with the hardware. Then try some faster EPROMs. If it still doesn't work
at 20 MHz with the faster EPROMs, you may have another chip with sluggish
timing in there. Since the behavior is replicated in two units, however,
I'd tend to think it is the EPROMs.

Sounds like PacComm supplied the wrong EPROMs with your units. That
could have been a production mixup. Bang on Gwyn's head again and
try to get him to send you a new set. I don't have many complaints
about PacComm, but getting them to return a call or answer their
mail promptly is sometimes a problem. If you're persistent, you can
get results.

The fact that it is crystal controlled should be viewed as an advantage.
Nothing screws up network routing faster than a user who won't stay put
on his LAN frequency. There are many cases when you'd like to have more
than 5 watts output, however. Fortunately, 5 watts is typical HT output
level so any HT amp can be used to boost the unit to a reasonable power
level if running barefoot won't do. Just be sure to wire PTT and the
amp external key line in parallel. Don't depend on RF sensing to key
the amp, that's too slow.

These radios work well at 9600 baud. That's the real reason to have
one. For 1200 baud, any old FM radio will do. The only real drawback
that they have is a broad receiver front end. You have to run a filter
in front of them at a high RF site. They should be Ok without it at most
home stations though.

hi folks.
i'm looking for "pager for Amateur" handbook published by kantronics.
couple of days ago , i emailed to kantronics. however, no response.
pse let me know where i can find this book.
Also if u have experience of this experiment , pse let me share ur
experience.
appreciate any advance.

I received an answer from burt lang <burt@rocler.qc.ca> directly, he apparently did not respond to the newsgroup.

Burt suggested setting Mode 4 to 1. This setting disables Node broadcasts on port 1 but allows them to continue on port 0. After making the change 'mo /4 1' the flush counter stopped incrementing. This is thus the solution.

In fact the reduction in overhead from this setting is probably insignificant. Maybe I am tinkering just a little too much!

KAWIN NEWS - Announcing KaWin 6.47

KaWin 6.47 is ready for download from the KaWin Home Page:

http://www.mutadv.com/kawin

Enhancements include:

Support for the Radio Amateur Callbook ("Flying Horse") Call Sign Database, including automatic lookup on connect.

Distance, heading to station and reciprocal heading from station is now included in the result of a call sign database lookup.

New "p" and "l" macros to insert your geographic position coordinates and locator grid.

Any macro may now be forced to uppercase.

A "Print Selection" command joins the Pop-Up menu.

The first edition of the KaWin "Frequently Asked Questions" (FAQ) is now a part of both the KaWin Help file and the KaWin Home Page. I am still compiling "Tips" for a separate topic and your contributions are needed. Input is solicited from tire-kickers as well as new and old registered users.

Please send all contributions to: stan@mutadv.com

The KaWin News mailing list has been purged of all problem email addresses. If your address was inadvertently removed please accept my apologies and re-subscribe. Please pay close attention to the email address you provide and/or the "reply to" address set in your email client.

To subscribe to the KaWin News mailing list, send email to stan@mutadv.com with the word SUBSCRIBE in the subject line, or use the handy subscription link on the KaWin Home Page. To be removed from the list, send email to stan@mutadv.com with the word UNSUBSCRIBE in the subject line and be sure to include the email address this message was sent to in the body. I cannot remove you if I don't know your address!

>only look at the samples at +-9 and +-5, but they seem to perform better
>than the FIR band-pass filters I've tried. (Designed using fir1() in
>matlab)

Yeah, the filters are filters, they don't care how many cycles you
have, they're just implementing an impulse response. You're sampling
at 22 kHz, so you have a little over 18 samples per bit interval. That's
plenty. A quick look at requirements shows that you'd need a FIR filter
with 241 taps to get a suitable response. That's costly. An IIR filter
would only need to be 4th order to give a satisfactory response. Here
are the coefficients for a suitable 1200 Hz BP filter with a bandpass
from 1190-1210 Hz and -22 db stopband response outside 1100 and 1300 Hz.

Numberator Coefficients Denominator Coefficients
() + z^-1 + z^-2 () + z^-1 + z^-2
1.0 -1.85460029 1.0 1.0 -1.88311182 .997731543
1.0 -1.90711038 1.0 1.0 -1.87995955 .997701794

And here are the coeficients for a 2200 Hz filter with a bandpass from
2190-2210 Hz and a -22 db stopband response outside 2100 and 2300.

Numberator Coefficients Denominator Coefficients
() + z^-1 + z^-2 () + z^-1 + z^-2

1.0 -1.56893232 1.0 1.0 -1.61892246 .997723787
1.0 -1.66208402 1.0 1.0 -1.613344641 .997709178

Feed your sample stream through these two filters (parallel), and the
output streams will be M[i] and S[i].

>>In either case, you wind up with two data streams, M[i], S[i],
>>representing the two tones as the outputs of the two filters.

>because I'm not getting good edges.

Well, those filter equations above are very crude smoothing filters.
Better would be to implement a IIR lowpass filter as your envelope
filter. A simple 3rd order filter will do. Here are coefficients.

Numberator Coefficients Denominator Coefficients
() + z^-1 + z^-2 () + z^-1 + z^-2
1.0 1.0 0.0 1.0 -.857633738 0.0
1.0 -1.71799797 1.0 1.0 -1.80624564 .910026689

>>>> WRT: adaptive slicer
>>Yslice=(k*Yslice+Ym[i]+Ys[i])/3

k tends to pull it back toward zero. A long run will bias the slicer,
but it recovers quickly.

>> | for Ym[i]>Yslice, Data=1
>>Data=|
>> | for Ys[i]<Yslice, Data=0
>
>I'm assuming it is acceptable to compare the sum of Ym[i] and Ys[i] to
>Yslice rather than using the equation above, which can frequently return
>Data equaling both zero and one.

Yes, you're right. In fact they can be summed before passing through
the envelope lowpass filter, so you'll only need one of those. Note you have
to normalize values, however. Divide the sum by 2, IE

Ysum[i]=(Ym[i]+Ys[i])/2.

Ysum then gets passed through the envelope lowpass filter above, and the
output of the filter, call it Gsum, goes to the decision circuit.

The decision will then be

| for Gsum[i] > Yslice, Data=1
Data=|
| for Gsum[i] < Yslice, Data=0

>>You'll now have clean demodulated serial data. You still have to
>
>I'm not getting clean data... The original signal is very clean, so I
>really shouldn't be having much of a problem. Is it because my filter is
>too short, because my low-pass envelope filter is too narrow, or something
>else?

I think it is because of the way you're implementing the FIR filter.
Note that you need a 241 tap FIR filter to get the bandpass response
you need. It sounds like you're only using a 17 tap filter at most.
That will hardly work at all. Remember that the filters run all the
time, on all samples, not just during an expected bit interval. That's
how they create the required response function. They aren't dependent
on the number of samples per bit (as long as Nyquist is happy) in order
to work. The IIR filters I gave you should work fine, and are probably
less costly in processor cycles than a 241 tap FIR.

>How does this 16x bit clock work? Do mean having 16 samples per bit?
>Right now, there are 18 samples (22000/1200) per bit, so that's not much
>of a difference. Would I be better off making the low-pass envelope
>filter average over 18 samples?

No. The clock is implemented as a counter. That counter is clocked
at 16*1200=19200 counts per second by a reference clock. You can
use the system clock "tick" for this with suitable scaling, or
grab one of the other system counter/timers to implement it directly.
The counter is modulo 16, IE it counts from 0 to 15 and then rolls
back over to 0. While count is less than 7, output a 1, while count
is greater than 7, output a zero. This is your 1x clock, and the
edge occurs at the data bit center. This is how you clock the
serial data into a software equivalent of a serial in->parallel

out shift register to convert from an unframed serial bit stream
to parallel ASCII characters the computer can use.

Now initially, the count will not be synchronized with your bits.
To synchronize it, set the counter value to zero at the start
bit transition. After that, add or subtract one from the count
depending on whether the 16x edge is early or late compared to a
data edge. This is what forms the digital PLL and locks the clock
to your data timing.

>>You appear to be attempting to "flywheel" such a clock from the
>>zero crossings of the tone burst at the head of the data. That's
>>not a great idea because you're using a reject instead of pass filter
>>to capture that tone, the zero crossings are corrupted by channel noise,
>>and clock drift becomes a problem during message reception. You'd be much
>>better off using a digital PLL to recover a data clock.
>
>actually, it synchronizes using the raw data. There are about 150
>cycles of carrier. It divides the number of samples by the number

>is... It figures 18.37037 samples as an average time period, but
>the actual period is either 18.375 or 18.518. I'm not sure which it
>should be, as some sound cards round the sampling rate from 22050 HZ
>to 22222 HZ, but it works almost perfectly when I chose 18.518.

Ok, now I see the problem. You're depending on the data bits being
synchronized to the tone cycles. You can't do that. Now in this case
the FSK is synchronous, but the *character* timing is *not*. The data
is transmitted as *asynchronous* characters. The interval between
characters is not guaranteed to be any particular value. It is
guaranteed to be some integer multiple of the cycle rate because
the *FSK* is synchronous, but it can be *any* multiple, IE characters
could come butted together or spaced any arbitrary number of tone cycles
apart. This blows your clocking scheme totally out of the water
as a means of extracting character framing information.

Your character clocking has to be synced by the start bit of
each individual character, IE a start bit transition has to
reset the clock counter to zero for each character. This may
be the major part of your problem. Your crude attempts at
filtering might work, except you aren't framing the characters
properly.

Note that there are two *very* different clocks here. First
there is the sample rate of the A/D converter in the sound
card. As long as that's at least 2x Nyquist, it doesn't really
matter what its rate or timing is. Then there is the bit rate
clock. That *must* be synchronized to each individual character
because asynchronous characters have no guaranteed start time.
That's totally arbitrary with respect to anything else. That's
why you need the digital PLL to generate a bit clock for the
bits of each character so you can do a serial to parallel

conversion of the characters.

On Monday, Dec 9, 1996, Jim wrote:

"I was wondering if anyone out there has any comments, good or bad about KaGold software for my Kam plus Tnc. Any comments will be appreciated. 73 de Jim, KE3OP ..._._"

Jim,

I hope it's okay with the other participants of the forum if I take uour "Any comments will be appreciated" invite.

KaGOLD is a DOS based program, but designed to multitask in Windows, OS/2, etc. Many users run it in Windows 95. One of the advantages of running any DOS program in Windows (assuming it is well-behaved) is that when it is resized, it uses a different font rather than presenting the user with a partial screen and scroll-bars. Unfortunately, Microsoft chose to make Windows fully graphical, and to date, there are no reasonable algorithms for either reducing a pixel oriented graphic in size, or making it larger, without creating distortions in the image.

DOS apps in Windows use FONTS, and when the user resizes the application, Windows renders the screen using a different font (if the properties are properly set). As a result, it is possible to run several DOS apps, on one screen, and have the ENTIRE app visible, not just a portion of it. Basically, although Windows can multitask the CPU and other resources, it does a relatively poor job of multitasking the screen due to the inability to resize multiple winapps that are all basically intended to run full-screen/full-window.

Also, KaGOLD is dual port, but runs the KPC-3 in single port mode. It also supports all of the text modes (not fax -- which is better when viewed with a multi-level gray scale program anyway). Kantronics has been including a copy of KaGOLD testdrive version 9 with their tncs, doing this since last March as I understand it.

6508. TX Delay effect on thru-put.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-11 00:00:00 UTC
From: Ron Stordahl <ron@digikey.com>
Message-ID: <32AF09B3.261D@digikey.com>
Source record: 33014

Has anyone any data on the effect of TX Delay setting of a node upon thru-put.

I have found that with Micors and MFJ1270C's it is possible to run the TX delay down to as little as 100 ms (ie set at 10). Similarly equiped nodes will work with each other with settings that low. But users often have difficulty, thus 150 ms seems to be a bare minimum. In practice most nodes are set at 300/350/400 ms, although we have one in the area which is set at an unbelievable 800 ms.

Anyone have any hard data on this?

>Steve Stark N4YOG (steves68@mindspring.com)

Can't comment on the APRS specifics but I do know that
about half of the DSP-232's firmware modes have bugs in them.

In in original V1.0 firmware, the unit isn't CCIR compatible, won't
properly maintain phase-lock in AMTOR/SITOR mode B,
can't maintain phase-lock in Navtext, has only mediocre copy
in PACTOR, not all modems are implemented, etc, etc.

I recently talked with the ARRL about their recent review
of the DSP-232. They admit that they didn't have the unit
long enough to discover all of the software bugs which have
now come to light.

AEA recognized this and has shipped revised frimware chips.
Did you send in your coupon packed with the DSP-232???

I got the new firmware chips about two weeks ago.
Haven't installed them yet so don't know how much they will
help although reports are that some of the bugs have been eliminated.

If you haven't received the new chips by now it's is probably too late
- with AEA shutting down.

Hopefully, someone will pick up the firmware support for their TNC
product line. There's probably a good business in upgrading PK-232,
DSP-232 and other model's firmware.

[lots cutted]

Hi Ethan:

You hit it!
I know almost nothing about DSP, but, as far as i know, you can't
apply any filtering to one or two cycles signals because the system
can't reach steady state, and the Fourier transform of such signals
shows they spread trought a wide set of frecuencies, so they are
overlapping and you can't get enough diference between the two
subbands.
I remember the old good SINCLAIR SPECTRUM 48k and AMSTRAD 64k (Z80
machines) which had an audio tape as mass storage device. They used
the same method you are trying to implement in PC with SB to save to
and read from the tape, and the solution is fairly simple:
Do some lo-pass filtering to avoid noise, and detect every tone by
simply counting the number of samples (or time) between two upwards
zero crosses.
IE:
(if you are not using this hell of windows the following looks like
correctly)

```
|header |start |data
samples ++++----++++----++--++--++++----++--++--
counts 4 + 4 4 + 4 2+2 2+2 4 + 4 2+2 2+2
average 8 8 4 8 4
bits 1 1 0 1 0
```

You have not said what your problem is. However, URS has a recall on
this
and other modems based on the firmware revision level. They will ship
you
a new ROM or exchange your modem free and shipping both ways is on USR.
The
recall is concerning a locking-up problem when accessing standard BBS's
etc.
Apparently it is not a problem when connecting to an ISP. I think the
bad
firmware is 2/10/96. Give USR a call or check their web site.

Hello Jim...

I have tried most of the software available and KaGold is, in my
opinion, the best around. Easy to install, has the most features and
great support !

Source record: 33024

Greetings to All:
I have been using my dj-582t on packet for a while. A friend has a dj-580t modified to receive up to about 900 mHz. A mod sheet that I got for the 580 says to cut the red wire and the blue wire for extended freqs. I can get down to the Aircraft freqs with AM, and up to about 511 mHz but no higher. I tried hitting the UHF button several times as someone else suggested but I'm still limited to 511 mHz.

Any serious suggestions will be appreciated.

Thanks and 73 de "A.C.", W5EZM

From: kwalker@qb.island.net
Message-ID: <58ld07$hv7@cliff.island.net>
Source record: 33148

I have not followed the development of the packet capable amateur satellites but I believe there are some in operation. As a sometimes off shore sailor and a radio amateur, I am asked by fellow sailors whether they should get a ham licence and how effective it would be. I tell them about 20m ssb, about hf packet and amtor but I also go on about how low earth store and forward packet satellites will be available one day. But maybe they are now?

The ideal packet system for offshore use would allow the offshore sailing ham to prepare a packet message and the software would determine when a bird is overhead and send up the message and pick up any waiting mail. Are these birds ready to do this? Is there software that would do it? Am I right that these can be worked with small omni antennas?

I think they require dual band operation? Which bands? Hopefully they are bands that can be worked with readily available dual band mobile rigs?

I have thought about this from time to time but I am not up to date on what is available. Anyone want to try to update me??

Thanks.

Fully functional. Included is a Macintosh computer, a TNC, a DC power supply and a two-meter FM radio. Software and manuals are included.

(1) $400.00
Mac Plus 2 Meg memory and built-in 40 meg hard drive
with keyboard and mouse.
AEA PK-232 MBX TNC unit
KDK 2033 (25 watts) 2 meter FM tranceiver
Azden DC power supply
All cables for direct plug-in

The unit is at my home, in Hampton, Minnesota, USA. The prices reflect US dollars, and do not include shipping.

The Mac computer equipment can be split from the above package.

System is now on the air on 145.050 Mhz.

Thank you! -Mike K0JTA

>When we had 255.255.255.0, every bit of JUNK that comes out of wfw3.11
>goes out onto RF. They guy that I was with knows his TCP/IP stuff
>pretty good BUT we're always welcome to suggestions !!

>Cheers..Pete..vk2yx

Not true, 255.255.255.0 is the proper subnet for the above example.

Only addresses that do NOT exist on the subnet 44.136.15 will go through the gateway. 14 & 15 are both on the same network.

The '255' is a wild card of sorts. Since we have 3 '255's, anything that has the same first three parts is considered local.

Bob,

this is info about 9600 bps mods for FT290/790 from my acrhive.
I used it some time ago and it run well.
I hope it will be usefull for you.

MODEM @WW de:DL6DBN 23.09.90 07:50 0 1568 Bytes
FT290/790RII mods. PSK/9k6
*** Bulletin-ID: 229008DB0SGL ***

900922/0911z DK0MWX, 900922/0714z DB0SGL
de DL6DBN @ DB0SGL

How to modify YAESU FT-290 RII and FT-790RII
for 1200 BpS PSK and 9600 BpS FSK

As you know, for 1200 BpS PSK/FM a direct injektion of the signal into the FM-varicap is recommended and for 9600 BpS FSK necessary. For 9600 BpS you will need the FM-discriminator output.

Due to SM-Technology the following modifications are not easy to manage.
FT-790RII in ()

The FM-discriminator output is at pin 9 of Q4001 (Q402) MC3357P. Use a shielded cable to connect this pin with your 9k6-modem input. The IF-bandwidth of CF01 (CF01) CFW455F seems to be to small for very good results, so I recommend to exchange it with a CFW455D. With good RF-strength and proper tuning the CFW455F can fit as well.

The more complicate modification is the injection point. Inject your TX-signal below the main unit where R30124, C30120 and C30126 (R30117, C30117 and C30124) come together (all SMD). Is it necessary to say, use a shielded cable? As long as no other AF from the tone unit or the microphon reaches this point you must not cut any connections. But adjust your FM-deviation.

I made this changes in both radio sets and had already good contacts via UoSAT-OSCAR 14. So good luck and success.

This is good to know. I'd also add that I've just learned that there
are now about 1000 PTC-IIs in amateur hands. So usage is growing.

Yes, you can filter the signals. With either an analog or digital
BP filter, the envelope which you retrieve out of a BP filter for
a 1 cycle input is basically the impulse response of the filter.
The waveshape isn't the same as the input, but that doesn't matter
for our purposes here. We just want the energy envelope, and we'll

get that out of the abs() function.

>bits 1 1 0 1 0

This works with *synchronous* data, but the characters in Caller
ID are *asynchronous* ASCII. This means you may have an arbitrary
amount of mark carrier between characters. That throws your framing
off if you just count cycles.

6531. AEA DSP-232 help, please! TX prob on cw mode

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-12 00:00:00 UTC
From: sg <genzx001@gold.tc.umn.edu>
Message-ID: <32B03201.1D37@gold.tc.umn.edu>
Source record: 33033

Greetings and thanx for reading this posting. I seem to not be able to tx on CW mode when I press the tx button in Macratt III. Other modes will tx....
Is anybody else experiencing this problem??? I also was curious to know if SIAM mode actually works... I seem to get stuck in that mode after i try to change to another mode. After a couple of tries, my program gets buggy and I have to replace the copy....
This leads to another question... IS pc-pacratt for windows good? Any major bugs in it? Any other software suggestions? Thanks! 73's

6532. Re: TX Delay effect on thru-put.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-12 00:00:00 UTC
From: swoodwar@fix.net
Message-ID: <58p71p$kem@twizzler.callamer.com>
Source record: 33034

The TX delay should be set at the minimum the radio will accept and transmit data everytime without the other end asking for repeats.

For synthesized radios this is usually 250-350 ms. For xtal controlled radios, it can be as little as 8-10. Just depends on the radio. And believe me, it makes a big difference in thruput. We have 6 nodes in this area using both types of radios and have "fine tuned" each node for optimum thruput. Settings of 800 is unreal, unless the radio is defective and the PLL will not lock in under that amount of time.

6533. BPQ Parameters / PACLEN

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-12 00:00:00 UTC
From: Ron Stordahl <ron@digikey.com>
Message-ID: <32B03E8E.6DA2@digikey.com>
Source record: 33035

The BPQ documentation is unclear, at least to me, regarding PACLEN. The parm is stated in the Network System Parameters as well as in the PORTs sections. In the BPQCFG file which follows PACLEN=256 in the beginning and PACLEN=128 in the PORTs. It works, but is it the best choice?

I have read conflicting articles which recommend a maximum packet length of 238 (This is a but fuzzy, it was something like this). The protocol will add additional fields bringing up the total to as I recall 256. If the packet is longer than that I recall it was suggested that the nodes would have to break the packet into pieces, increasing overhead.
You can see I am grabbing for straws here!!

Ill try to simplify the question:

If the paths used are highly reliable, what what would be the best values of PACLEN in the Netowrk System Paramter section and in the PORTs sections?

Thanks for your guidance

BPQCFG.PUJ is attached as a text file, I can't seem to find the option to attach it inline. Sorry!

6534. $$$$ $50,000 for the New Year $$$$

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-12 00:00:00 UTC
From: invest@goldbergservices.com
Message-ID: <58oa86$f2l@hil-news-svc-5.compuserve.com>
Source record: 33036

$$$$ $50,000 for the New Year $$$$

Take five minutes to read this and it WILL change your life.

The Internet has grown tremendously. It doubles in size every 4 months. think about it. You see those 'Make.Money.Fast' posts more and more.
That's ... because it WORKS ! So I thought, all those new users might make it work. And I decided to try it out, a few months ago. Besides, whats $5.00, I spend more than that in the morning on my way to work on coffee and cigs for the day. So I sent in my money and posted.Everyone was calling it a scam, but there are SO many new users from AOL, Netcom, etc. they will join in and make it work for you.

Well, two weeks later, I began recieving bucks in the mail! I couldn't believe it! Not just a little, I mean big bucks! At first only a few hundred dollars, then a week later, a couple of thousand, then BOOM.
By the end of the fourth week, I had recieved nearly $47,000.00. It came from all over the world. And every bit of it perfectly legal and on the up and up. I've been able to pay off all my bills and still had enough left over for a nice vacation for me and my family.

Not only does it work for me, it works for other folks as well. Markus Valppu says he made $57,883 in four weeks. Dave Manning claims he made $53,664 in the same amount of time. Dan Shepstone says it was only $17,000 for him. Do I know these folks? No, but when I read how they say they did it, it made sense to me. Enough sense that I'm taking a similar chance with $5 of my own bucks. Not a big chance, I admit--but one with incredible potential, because $5 is all anyone ever invests in this system. Period. That's all Markus, Dave, or Dan invested, yet their $5 netted them tens of thousands of dollars each, in a safe, legal, completely legitimate way. Here's how it works in 3 easy steps:

STEP 1.

Invest your $5 by writing your name and address on five seperate pieces of paper along with the words: "PLEASE ADD ME TO YOUR MAILING LIST." (In this way, you're not just sending a dollar to someone; you're paying for a legitimate service.) Fold a $1 bill inside each paper, and mail them by standard U. S. Mail to the following five addresses:

1-Aaron McDaniel
2014 Powell Dr.
ElCajon, Ca 92020

2-Faroon Khan
12343 77A Avenue
Surrey, BC V3W2W9

3-Hoffman Eric
3150 Riviere-Cachee
Boisbriand, PQ
Canada
J7H 1A3

4-Stuart Koch
Connolly Hall Box C115
501 E. St. Joseph
Rapid City, SD 57701-3995

5-Karen Lundgren
3889 Kencrest Ave.
Halifax, NS
Canada
B3K 3L4

STEP 2.

Now remove the top name from the list, and move the
other names up.This way, #5 becomes #4 and so on.
Put your name in as the fifth one on the list.

STEP 3.

Post the article to at least 250 newsgroups. There are at
least 19000 newsgroups at any given moment in time.
Try posting to as many newsgroups as you can. Remember
the more groups you post to, the more people will see your
article and send you cash!

STEP 4.

You are now in business for yourself, and should start seeing
returns within 7 to 14 days! Remember, the Internet is new
and huge. There is no way you can lose.

Now here is how and why this system works:

Out of every block of 250 posts I made, I got back 5 responses.
Yes, thats right,only 5. You make $5.00 in cash, not checks or
money orders, but real cash with your name at #5.

Each additional person who sent you $1.00 now also makes 250
additional postings with your name at #4, 1000 postings. On
average then, 50 people will send you $1.00 with your name at
#4,....$50.00 in your pocket!

Now these 50 new people will make 250 postings each with your
name at #3 or 10,000 postings. Average return, 500 people= $500.
They make 250 postings each with your name at #2= 100,000
postings=5000 returns at $1.00 each=$5,000.00 in cash!

Finally, 5,000 people make 250 postings each with your name at
#1 and you get a return of $60,000 before your name drops off

the list.And that's only if everyone down the line makes only 250 postings each! Your total income for this one cycle is $55,000.

From time to time when you see your name is no longer on the list, you take the latest posting you can find and start all over again.

The end result depends on you. You must follow through and repost this article everywhere you can think of. The more postings you make, the more cash ends up in your mailbox. It's too easy and too cheap to pass up!!!

So thats it. Pretty simple sounding stuff, huh? But believe me, it works. There are millions of people surfing the net every day, all day, all over the world. And 100,000 new people get on the net every day. You know that, you've seen the stories in the paper. So, my friend, read and follow the simple instructions and play fair. Thats the key, and thats all there is to it. Print this out right now so you can refer back to this article easily. Try to keep an eye on all the postings you made to make sure everyone is playing fairly. You know where your name should be.

If you're really not sure or still think this can't be for real, then don't do it. But please print this article and pass it along to someone you know who really needs the bucks, and see what happens.

REMEMBER....HONESTY IS THE BEST POLICY.YOU DON'T
NEED TO CHEAT THE BASIC IDEA TO MAKE THE BUCKS!
GOOD LUCK TO ALL, AND PLEASE PLAY FAIR AND YOU WILL
WIN AND MAKE SOME REAL INSTANT FREE CASH!

*** By the way, if you try to deceive people by posting the messages with your name in the list and not sending the bucks to the people already included, you will not get much. I know someone who did this and only got about $150 (and that's after two months). Then he sent the 5 bills, people added him to their lists, and in 4-5 weeks he had over $10,000!

TRY IT AND YOU'LL BE HAPPY!!! :o) !!!!!!!!!!

6535. RTTY Sprint this weekend

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-12 00:00:00 UTC
From: Tom Remmert-N2TR <tremmert@waymark.net>

The annual TARA RTTY sprint is THIS weekend.

Please see http://generators.com/tara/rtty.html for rules, details, etc.

This is a great warm up for the ARRL RTTY contest in January.

6536. Kam Plus

Newsgroup: rec.radio.amateur.digital.misc

Source record: 33038

I'm considering getting a Kam Plus multi-mode controller:

1. What are the differences between V6, V7, and V8 firmware?
2. How well does the CW mode work? I hear guys going over 30WPM and it would be interesting to know what they were saying!
3. How well do the Digital Modes do in general? Will say Pactor get through when all other modes (including CW) can't?

6537. Re: 1200 baud FSK demodulation in software

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-12 00:00:00 UTC
From: ethan@cs.wisc.edu
Message-ID: <58pshi$m8q@news.doit.wisc.edu>
Source record: 33039
Cross-posted to: comp.dsp,rec.radio.amateur.digital.misc

First, I finally got it working. I'd still like to improve it a bit,
as it takes around 200 ms to decode the data, and I only have 100 ms
before the next buffer comes in. I could make it work now, but it
would mean discarding a few buffers whenever it detects a tone.

In <1996Dec11.183310.26190@ke4zv.atl.ga.us>, Gary Coffman wrote:
> In <some article>, Ethan Brodsky wrote:
>>I've tried this, with fairly bad results. I think the problem is that I

>...
>Yeah, the filters are filters, they don't care how many cycles you
>have, they're just implementing an impulse response. You're sampling

So they will work if you have a large number of cycles and one
frequency and then one at another? I've found that the larger
filters seem to have a slow response time; producing all sorts
of wierd-looking data during the transitions.

>plenty. A quick look at requirements shows that you'd need a FIR filter
>with 241 taps to get a suitable response. That's costly. An IIR filter
>would only need to be 4th order to give a satisfactory response. Here
>are the coefficients for a suitable 1200 Hz BP filter with a bandpass
>... coefficients cut ...

241 is way out of line, as it would take several seconds just to filter
the data. It's working with the order-16 FIR filter, but I'd prefer to
use this IIR filter, as a four adds/muls and two divs should be faster
than seventeen adds and multiplies. The IIR filters work like:
y(n) = ((1 - 1.85*x(n-1)+1*x(n-2)) / (1 - 1.88*x(n-1) + 0.99*x(n-2))) +
((1 - 1.90*x(n-1)+1*x(n-2)) / (1 - 1.87*x(n-1) + 0.99*x(n-2)))
correct? I haven't gotten to the IIR chapter yet, but that's what I
can remember from scanning it. Of course, I'll use 20 or so bits for
the coefficients with fixed point. This looks like it will be a lot
faster than what I'm using now.

> . . . 2200 filter cut . . .

>Well, those filter equations above are very crude smoothing filters.
>Better would be to implement a IIR lowpass filter as your envelope
>filter. A simple 3rd order filter will do. Here are coefficients.

It's now working with a three sample envelope filter, using the
formula y(n) = (x(n-1)+2*x(n)+x(n+1)) / 4. Will the IIR filter
give me that much better response in exchange for the extra

division?

>...

>>Right now, there are 18 samples (22000/1200) per bit, so that's not much
>>of a difference. Would I be better off making the low-pass envelope

>serial data into a software equivalent of a serial in->parallel
>out shift register to convert from an unframed serial bit stream
>to parallel ASCII characters the computer can use.

ok... I see what you're getting at. I'm not doing this in real-time,
so everything is implemented as post-processing of a data stream.
What I'm doing now is iterating through the array in 18 sample (approx.
one bit) increments. I integrate the output of the slicer over the
interval and comprate it to 1/2. If it is different from the average
of the previous integral, I move forward or back one sample depending
on whether the transition is ahead of or behind the predicted point.

>Now initially, the count will not be synchronized with your bits.
>To synchronize it, set the counter value to zero at the start
>bit transition. After that, add or subtract one from the count
>depending on whether the 16x edge is early or late compared to a
>data edge. This is what forms the digital PLL and locks the clock
>to your data timing.

That's essentially what I'm doing. I actually synchronize by looking
for the end of the carrier and starting there. That way I don't risk
missing the first bits and I don't have to do all the filtering
and analysis for 100 ms of carrier.

>Ok, now I see the problem. You're depending on the data bits being
>synchronized to the tone cycles. You can't do that. Now in this case
>the FSK is synchronous, but the *character* timing is *not*. The data
>is transmitted as *asynchronous* characters. The interval between
>characters is not guaranteed to be any particular value. It is
>guaranteed to be some integer multiple of the cycle rate because
>the *FSK* is synchronous, but it can be *any* multiple, IE characters
>could come butted together or spaced any arbitrary number of tone cycles
>apart. This blows your clocking scheme totally out of the water
>as a means of extracting character framing information.

I can't find anything on whether the data is synchronous or async,
but my old fly-wheel method worked. There were ususually one or

two stop bits, and I didn't notice a larger number of errors made there. (one of the two I found when decoding bitstreams by hand was there, but that's certainly not indicative of a large problem, especially now that it works perfectly) Maybe it's allowed to be async, but the phone companies transmit it without a delay to speed up transmission.

>Your character clocking has to be synced by the start bit of
>each individual character, IE a start bit transition has to
>reset the clock counter to zero for each character. This may
>be the major part of your problem. Your crude attempts at
>filtering might work, except you aren't framing the characters
>properly.

right now that will be fairly difficult, as my test program simply demodules the data and produces a bit-stream, which I use another program to decode into ASCII data. When I put it all together into my final program the parts will be integrated and I will know which bits are start/stop bits. I'll check into my docs to see if it is indeed async.

>Note that there are two *very* different clocks here. First
>there is the sample rate of the A/D converter in the sound
>card. As long as that's at least 2x Nyquist, it doesn't really
>matter what its rate or timing is. Then there is the bit rate
>clock. That *must* be synchronized to each individual character
>because asynchronous characters have no guaranteed start time.
>That's totally arbitrary with respect to anything else. That's
>why you need the digital PLL to generate a bit clock for the
>bits of each character so you can do a serial to parallel
>conversion of the characters.

Would I be better off having it move forward or back to the next transition instead of only by one sample? That might help in some cases, although I worry that there will be some case in which the transition is screwed up and it decides to throw itself completely out of phase.

Thanks to everyone for the help in getting this solved. I had a method that worked almost perfectly before, but I couldn't figure out a way to get those last few bits correct, making it unusable. Now it works great, and I should be able to get it down under 100 ms,

Ethan Brodsky

6538. Cross band packet on Kenwood 733??

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-12 00:00:00 UTC
From: Don Labriola <dplabriola@ccgate.dp.beckman.com>
Message-ID: <32B07B2E.7E46@ccgate.dp.beckman.com>
Source record: 33040
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.digital.misc,rec.radio.amateur.misc

Would anyone know of a setup mode or procedure to allow the Kenwood 733a to receive packet on one of the halves (UHF) and transmit on the other (VHF) via the packet connector. What I'm really doing is trying to use the packet connector to connect into an AEA radiolink controller for use as a remote, and the packet connector provides 1) a shielded audio input with PTT (the normal mic is hard to shield), 2) Audio out, and 3)Squelch detect (COR) output. I can get any two by other methods. The packet, as far as I can tell, will only direct the received audio from the side that is selected as transmit (PTT), not from the selected "control" channel.

Any suggestions or help is appreciated. (Please also E-mail - I don't always get to read all of the news groups before they go stale - our local news server tends to have a fairly short memory span!)

The instructions for cross band repeat can be found on the Kenwood web page

http://www.kenwood.net

They dont put the instructions for cross band repeat or wireless memory
programing (to a like rig) and wireless remote control

because many of those features are not leagle in certain cournties.

Go to the web bage and look for the tech notes.

Enjoy.

Source record: 33043

On Thu, 12 Dec 1996, Ron Stordahl wrote:

The BPQ documentation is unclear, at least to me, regarding PACLEN. The parm is stated in the Network System Parameters as well as in the PORTs sections. In the BPQCFG file which follows PACLEN=256 in the beginning and PACLEN=128 in the PORTs. It works, but is it the best choice?

In my experience with Packet, if as you say your path is a good solid one with excellent signal, you try to obtain maximum thruput by setting paclen to the max (255) and also maxframes to the max (7). I relay all the incoming Army Mars traffic off the internet into the local MARS Packet BBS exactly as above, and its amazing how fast those long winded messages rip thru without a single frame rej. Some are real long ones too but it really rips on VHF.

Packet system is fully functional, and includes a Macintosh
computers, a TNC, a DC power supply and a two-meter FM radio. Software
and manuals are included.

-------- Package for a total of $400.00 ---------
- Mac Plus 2 Meg memory and built-in 40 meg hard drive
(with keyboard and Kensington trackball)
- AEA PK-232 MBX TNC unit
- KDK 2033 (25 watts) 2 meter FM tranceiver
- "Azden" DC power supply (a look-alike copy)
- All cables for direct plug-in

------ If the Mac is not needed, the price is $275.00 -------

The Azden radio is modified for direct connection to the AEA packet
system.

All cabling is clearly marked, and included.

All related manuals are included for this packet system. All
modifications are clearly documented.

The front panel VOLUME control is independent of the packet's audio
input.

The two-meter radio is rated at 25 watts. It uses solid-state
TX-RX switching, so the overall system is silent in operation, as the
packet system works.

The PK-232 MBX has the most recent ROM upgrade. (I believe the
date is early 1996...)

These units are at my home, in Hampton, Minnesota, USA. The prices
reflect US dollars, and do not include shipping.

Thank you! -Mike K0JTA

I'm adding a new feature to my Windows logging/packet system XMLog. If you double click on a frequency displayed in the packet window (e.g. a PacketCluster DX spot) I set the appropriate mode/frequency for the rig.

I've got it working for my Kenwood 950 but I want to add support for other radios. Can anyone give me the commands and the port setup for other radios? For example, the 950 wants the serial port set to 4800 baud, 8 data bits, 1 stop bit, even parity. Commands to set the radio to 14.350 USB would be:

FA00014350000; and
MD2;

I assume (hope) that Kenwood radios other than the 950 use these same commands.

XMLog is freeware available at http://franklin.ptgi.com

I understand from reading an email from a reflector that there
is a NEW EPROM which includes some NEW MODES. I saw the list,
and among them was a ZERO CROSSING DETECTOR mode that can be
used with any of the common programs: JVFAX, MSCAN, DL4SAW, PROSKAN,
etc, etc...

I sold my 2232 a few months ago, but perhaps good news for others.

Maybe someone else has more information to add...

From: D.N.Muir@massey.ac.NZ
Message-ID: <199612132334.PAA08430@UCSD.EDU>
Source record: 32958

Greetings, all...

There has been a hiccup in the Digest distribution, somewhere between my provider (massey.ac.nz) and ucsd.edu, and I am missing the following Digests:

492
494 (scratch that, got it from archive...)
495, and
497, (scratch that, got it from archive...)

between the 7th and the 10th December. As far as I can tell, they are not in the archive: the script only processes one Digest per day. I archive these for local Hams, and try my best to get them all... and one or two of the current threads are of interest to me. Has anyone trapped these, who could email them to me (Mime attachments OK)?

Brian does a sterling job of maintaining the distribution, but once in a while someone else gets in there (Murphy? :-) and fouls things up. In a personal email on one such occasion, he said he needed to break a few fingers (look out, Murphy!), and he has my full permission: these hiccups are occurring in other Digest distributions from ucsd.edu, too, and there are probably others affected.

Best wishes to all for the coming Festive season, and 73 de ZL3LH.

The way I interpret it, PGP signatures are not codes or ciphers intended to obscure the meaning of a packet transmission. Therefore I assume it to be perfectly acceptable. That is, as long as the text of the transmission is not obsucred. As a matter of fact, it is my humble opinion that PGP SIGNATURES should be encouraged both on the air and off. I very much hope that people don't start attempting to use packet as a form of encrypted private communications... if they do I hope that they are punished in such a way as to make an example out of them.

PGP makes for a convenient way to verify that the originator of a message is in fact the person who affixed their call sign to it. It could be used to easily verify that a message to a system came from the control operator, as I am sure there are other potential useful applications where reliable identity authentication is necessary without the need for encryption of the body or content of the message.

>
> Hams would register a public key in some kind of white pages database.

> to the packet network.

I believe that there are many key server software packages available, and currently put into use on the internet now. I have never used one, so I cant say I know too much about them, but I doubt that implementing them over packet would too challenging.

Anyway, just a quick comment.

By the way, I have used PGP to sign this
message just in the same way that I suppose it could be done over packet. As you can see, the body of the message is freely readable, there is no code or cypher intended to obscure the meaning of a message, and there is a signature block (which is clearly identified as such)

affixed at the end of the body of the message.

I just copied a map of nodes in Arizona and the domain.txt for this area
to my public ftp area at electron.goodnet.com/pub/packet/. The map is
in WMF format - you can open it in Windows' clipboard or clipbook viewer
(I think) or import it into Corel or whatever. Word can also import these
files. Domain.txt is a list of Arizona TCP/IP packet systems intended for
use by NOS. No guarantees it's totally up to date but it was a few
months ago. If you succeed in accessing azgtwy.ampr.org from the
Internet (or if you're close enough to access it via packet) you can ftp
this stuff from there too.

James,

I would agree - get XPWare for Windows. Unlike KaGold, it is using the latest programming technology. Sure, KaGold will work in Windows 95, but since it is a 16-bit application, special memory must be set aside for it.

Also - KaGold hasn't been upgraded for YEARS.

6560. Help wiring up my Kantronics 9612. Kenwood TM733a for one radio operation

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-13 00:00:00 UTC
From: james-m@ix.netcom.com
Message-ID: <58rhpr$t17@dfw-ixnews10.ix.netcom.com>
Source record: 33052

Hello and thanks for reading this..

I am in need of help setting up my Kantronics 9612, and TM733a for one radio operation. I am not even sure if this is possible. What I would like to do is wire the radio and TNC so that I can get both 1200 and 9600 baud operation on the single 733.

I would also appreaciate if if someone could confirm my wiring by posting the output pin assignment for the TM733 in regards to the 9600 baud port of the 9612 and the 1200 port of the 9612.

Anyone else handling both ports thru one radio?? Is it even possible. The 9612 has a "oneradio" setting. But the manual doesn't go into detail about it.

Any and all help will be greatly appreciated

6562. Using the AEA DSP-232 with JVFax 7 on SSTV

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-14 00:00:00 UTC
From: g.grey@netaccess.co.nz
Message-ID: <58ufu6$k1i@granny.mac.co.nz>
Source record: 32964

Hi,

I have found that the AEA DSP-232 fax zero crossing detector (modem 19) works with JVFax 7.

The DSR line toggles in response to SSTV data. Using the HAMCOM interface selection allows me to copy pictures. The performance seems much better for low signal levels than with the comparator interface.

However the DSP-232 is not well documented (or at all) in some subjects.

I have noted that the DSP-232 zero crossing fax seems to be some sort of tracking filter. There is a strong switching signal on the DSR output at 1900Hz. This switching signal causes some aliasing or blotching of received pictures.

Anyone else played with this mode or have any more info?
Anyone got any info on the other Fax modems available in the DSP-232?

Regards
Gordon

6563. Who use Drake R8A for decode signals, or any other receiver?

Hi!!

For those of you who use Receivers for decode dgital signals
I have a question to make wich is :

How do you decode the digital signals?

I know it's a stupid question but I will try to explain, As far as I
know normally those receivers have a serial port for connection to the
PC, wich is normally for control the radio, but WHERE CAN YOU "LISTEN"
TO THE DIGITAL SIGNALS TO DECODE THEM, do you use the same connection
(the serial port RS232C) or do you ALSO have a audio cable connect
from the radio to a sound board on the PC?

This is my doubt. ANY HELP is welcome.

Thanks in advance

6564. $$$Make Money Fast$$$

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-14 00:00:00 UTC
From: pather@hotmail.com
Message-ID: <01bbe987$f649a960$50c89f88@panther>
Source record: 32966

DO YOU NEED MONEY... AND NEED IT NOW!!

THIS IS THE FASTEST... AND FAIREST... WAY I KNOW TO SHARE THE WEALTH!

Would you like to make thousands of dollars quickly, legally, and with NO CATCH?
"PRINT THIS DOCUMENT NOW"
Then keep reading... please take five minutes to read this article in its entirety... it will change your life. It has certainly changed mine! "
PRINT THIS ARTICLE NOW "

You can make up to, or over, $50,000 in only 4-6 weeks. I was browsing through these newsgroups, just like you are now, and I came across an article similar to this that said you could make thousands of dollars in only weeks with an initial investment of ONLY $5! And, like you, I thought " Yeah, right, must be a scam...". But, I was
intrigued... like most of us are...and so I kept reading. Anyway, the article said that you were to send $1.00 to each
of the 5 names and address and the article in at least 250 newsgroups... there are thousands!.. no catch...that was all you had to do.

So ofter thinking it over and talking to a few friends first, I decided to try it...ofter all, if it really was a scam all I would loose would be my $5 and the cost of 5 stamps, right...? Well, guess what... within 7 days, I started getting money in the mail...No kidding! I have to tell you, I was suprised to say the least. I still figured it would end soon and didn't give it too much thought. But then money kept coming in...tripling in numbers and multiplying by 10 nad 20 times the amount that I got the first week! In my first week I made about $20 or $30 .

But by the end of the second week, I had made a total of over $1,000!! In the third week, I had over $10,000, and it's still growing. This is my fourth week and I've made about $42,000 TOTAL...and the money is still coming in.

Let me tell you how this works and more importantly, WHY it works...also, make sure you print a copy of the article so you get the information off it and can begin making money yourself. The process is very simple and it consists of just 3 EASY STEPS:

Step 1: Get 5 separate pieces of paper and write the following statement on each sheet of paper..." PLEASE PUT ME ON YOUR MAILING LIST. YOU ARE NUMBER _____ ". Get five $1.00 bills (US)and place ONE inside each piece of paper that you just wrote on and fold the piece of paper so the bill will not be seen in the envelope (otherwise, nosey people who like to steal mail with money in it will get yours!). Put one folded note (with

your $1.00 bill US) inside the envelope and seal it. Do the same for each of the five names. You should now have 5 envelopes sealed, EACH envelope has a piece of paper with the message asking to be put on the mailing list and a $1.00 bill (US)hidden inside the paper, RIGHT..? This is IMPORTANT.... Make sure you have written the message on each sheet of paper... by doing theis you are creating a service and keeping everything PERFECTLY LEGAL... Now, mail the 5 envelopes to eaqch of the 5 addresses listed below:

1.K. Doake, P.0. Box 54016, Tulsa, OK 74155-0016

2.J. Johnson, 6930 Oak Vally Lane, Colorado Springs, CO 80919

3.I. Chow, Suite 607-4944 Dalton Dr. NW, Calgary, Alberta, Canada T3A 2E6

4.JG. Giguere, 24-14th Street, Borden, Ontario, Canada, L0M 1C0

5.B. Leung, 363 Hidden Vale Pl., NW, Calgary, Alberta, Canada T3A 5B6

STEP 2: Now take the #1 name off the list that you see above, move the other 4 names up (5 becomming 4, 4 becomming 3 etc..) and put YOUR NAME as number 5 on the list. You can slightly alter this article if you need to, editing what you feel you ned to edit.

STEP 3: Post your amended article...with your name as #5... to at least 250 newsgroups (I'm told that there are close to 18,000 of them!) and all you need is 250 or so, of them.
HOW TO DO THIS -- If you have Netscape 3.0, do EXACTLY the following:
A) Click on any nwesgroup like you were going to look at it, then click on "TO NEWS" which is on the far left when you're in the newsgroup page. This will bring up a box to type a message.
B) Leave the "Newsgroups" box like it is. CHANGE the "Subject:" Box to something flashy like... NEED CASH $$$ READ HERE $$$... or... "FAST CASH!!"
C) Tab once and you should be ready to type. Now, retype (only once) this entire article ... WORD FOR WORD ... except to insert your name at #5 and to remove #1 off the list, plus any other small changes you think you need to make. Keep almost all of it the same however!
D) When you're finished typing the entire article, click on FILE in THIS box (just above the SEND button... (NOT where it says NETSCAPE NEWS on the first box). Now click on "SAVE AS" in the dropdown menu. Save your article as a text file to you C: of A: Drive. DO NOT SEND OR POST YOUR ARTICLE UNTIL YOU HAVE SAVED IT! Once saved, move on to Step E below.
E) If you still have all of your text, send or post to this newsgroupnow by just clicking the "SEND" button (just below the "FILE" dropdownmenu and just above the C: button)
F) Here's where you're going to post to 250 or more, newsgroups ... OK... click on any newsgroup then click on "TO NEWS".. again, in the top left corner of your screen. Leave the NEWSGROUPS BOX alone again, put a flashy subject title in the SUBJECT BOX, hit TAB once and you're in the body of the message. Now click on the ATTACHMENT button (just below the

Subject Line). Another window will come up...click on PROCEDURE. Click ONCE on the file and then click OPEN and then OK. If Attachments Box and iet will be highlighted.
IF YOU USE ie: EXPLORER, it's just as easy ... Holding down the left mouse button, highlight this article. Then press the "CTRL" key and the "C" key at the same time to copy the article. Then print the article for your records to have the names of those you will be sending the $1.00 bills to. Next, go to the newsgroups and press "POST AND ARTICLE". A window will open... type in your headline in the SUBJECT area and then click in the large window below. Press "CTRL" and then "V" and the article will be placed in the window. If you want to edit the article , you can do so and then highlight and copy it again (so your edited article will be copied again and again to each newsgroup).
Now, everytime you post the article in a new newsgroup all you have to repeat is "CTRL" and "V" and press POST.
G) That's it! Each time you do this, all you have to do is type in a different newsgroup so you can post this message to 250 or more, DIFFERENT, newsgroups. I know, I know,... you've still got 249 to go!Don't worry, each successive article will only take about 30 SECONDS once you get the hang of it. Remember, 250 is the MINIMUM ... The more you post, the more money you will make!

That's it!... THAT'S ALL THERE IS TO IT ... JUST THREE EASY STEPS !!!
You are now in the mail order business and will start receiving your $1 envelopes from various people all over the world within days. REMEMBER... The more newsgroups you post to, the more money you will make! You may want to rent a P.0. Box eventually because of all the mail. If you wish to stay anonymous, you can come up with a name, such as "Manager" or "Investor" ... JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT, PLEASE.

Now... let me tell you WHY this system works...
Out of every 250 postings, let's say I only receive 5 replies... doesn't seem like much, does it? However, you will make $5 cash.. Not checks or money orders but CASH... with your name at #5. Each additional person who sent you $1 now also makes 250 additional postings with your name at #4... This is 1000 postings. On average then, 50 people should send you $1 with your name at #4 ... That's $50 CASH in your pocket! Now these 50 people will make 250 postings with your name at #3... that's 10,000 posting! Average return would be 500 people... that's
$500. Each of these people make 250 postings now with your name at #2 .....that's 100,000 postings ...average 5,000 return at $1 is $5000! Finally, 5,000 people make 250 postings each with your name at #1 and you get a return of $60,000 before your name drops off the list! And that's only if everyone down the line mekes only 250 postings each... REMEMBER?... The more postings you meke, the more money you make!

People have said, "What if the plan is played out and no one sends you the money?" So what! What are the chances of that happening when there are TONS of NEW honest users and NEW honest people who are joining the Internet and newsgroups every day and are willing to give it a try? Estimateare at 20,000 to 50,000 new users, EVERYDAY, with thousands of those joining the

actual Internet. Remember, play FAIRLY and HONESTLY and this WILL WORK... I promise you. You just have to be honest. Make sure you print this article out RIGHT
NOW (if it's not done yet).

Also... try to keep a list of everyone that sends you money and always keep an eye on the newsgroups to make sure everyone is playing fairly.

REMEMBER... HONESTY IS THE BEST POLICY... YOU DON'T NEED TO CHEAT THE BASIC IDEA TO MAKE MONEY!! Good luck to all and please play fairly and you will reap hugh rewards from this!
By the way, if you try to deceive people by posting the messages with your name on the list and not sending the money to the people already on the list, YOU WILL NOT GET MUCH RETURN! Someone I talked to (mean and cheap) just did that and he only made $150 after 7 to 8 weeks!! Then he sent the five $1 bills out... people added him to their lists ... and in 5 weeks, he had OVER $10,000! He than realize that there is no way to cheat with himself.

THIS IS THE FAIREST AND MOST HONEST WAY I HAVE EVER SEEN TO SHARE THE WEALTH OF THE WORLD WITHOUT COATING ANYTHING BUT FIVE DOLLARS AND A LITTLE OF YOUR TIME!
DO IT LIKE IT'S LAID OUT HERE... IT WILL WORK!!

I doubt you can mod the 582 to get the high UHF (cellular) stuff. The
582 came out just after the rules were changed to outlaw easily
modifying receivers to monitor cellphones.

Yeah, but you don't care if it is weird looking. You're going to
rectify the envelope anyway. All you care about is that it reports
the energy of the signal correctly, IE the area under the envelope
curve. The one cycle pulse will work its way through the filter,
traversing all the steps, before exiting the filter, so it achieves
the fully formed filter impulse response. The only problems with the
long filters are the computational cost and the long delay between
input and output. Since you're processing a stream, you don't care
about the long delay. The computational cost is a concern, however.

A 241 tap filter will take 241/22000=0.011 second to clock through.
Remember that each unit delay is of duration 1/sample. The problem
with such a long FIR filter is that you have to perform 241 multiply-
accumulate steps per sample. That's a lot of T cycles to do in 11ms

with a PC. DSP processors are optimized for that type of operation,
but the 80x86 is not.

Yes it should be. IIR filters include feedback. That makes them faster,
but it also can make them unstable. That's the cost of using IIR.

The IIR filter will give you a much better *characterized* response.
I frankly don't know what the response is of your smoothing filter.
It is somewhat arbitrary. The IIR filter may work no better for your
purposes, but there's no easy way to prove that because we don't really
know what the response is of the filter you are using now.

Ah, I hadn't realized you were operating out of realtime. That makes
a big difference. Since you can back up at will, you can use noncausal
techniques to acquire character sync.

>>Ok, now I see the problem. You're depending on the data bits being

>speed up transmission.

The characters are async, that's why they have start and stop
bits. The phone company may be transmitting them as quickly as
possible, thus having no gap between the stop bit of one character
and the start bit of the next, but that is not guaranteed, and
could vary depending on the load on the central office computer
which generates the Caller ID information. It will be best if
you assume that characters can start at random times in the
bit stream. That'll make your routines generic for any async
character stream.

>>Your character clocking has to be synced by the start bit of

>my docs to see if it is indeed async.

It is async. It doesn't matter that you are using two different
programs. You'll be recovering clock from the demodulated bit
stream anyway, and the sample clock is embedded in that due to
the nature of what you're doing. However, since you are operating

out of realtime, you'll have to synthesize the 16x clock differently
than the way I outlined. In fact, it would appear that you've been
synthesizing the clock using the sample rate as a reference. That
can work, but as you've probably discovered, it isn't a simple integer
relationship in that case (I believe you said it is actually a 18.518x
clock). Since you can backup to resync, however, that's not a major
problem. The key thing is that you need to resync the count at each
start bit transition.

>>Note that there are two *very* different clocks here. First
>>there is the sample rate of the A/D converter in the sound
>>card. As long as that's at least 2x Nyquist, it doesn't really
>>matter what its rate or timing is. Then there is the bit rate

>transition instead of only by one sample? That might help in some
>cases, although I worry that there will be some case in which the
>transition is screwed up and it decides to throw itself completely
>out of phase.

Stay with adjusting by one sample. You want to adjust the clock in
1 of 16x (or in your case 18.518x) steps. That way noise (which will
cause jitter in the bit transitions) can only throw the clock off
1/16th of a bit and the PLL will recover before the 16x clock gets
so far off that the 1x clock won't be sampling the correct bit. You
want to make the decision at the 1x rate, which should be timed to
the middle of a bit interval if you've synced the clock to a start
bit and only adjusted it afterwards by 1/16th steps.

In your non-realtime case, you'll do clock synchronization by skipping
a sample, or by backing up a sample, as you traverse the array. In other
words, you can't change the reference count, that's imbedded in the sample
rate. What you'll do instead is shift the way you look at the data in
relation to it. This is totally backwards from the way you'd do it in
hardware or in realtime DSP, but the effect is the same.

The big trick is in detecting start bits reliably. A start bit will
always be at least two bit intervals long since it is the concatenation
of the previous stop bit, any async idle time, and the start bit of the
current character. When you look for that every 16*(number of bits per
character) counts (or 18.518 times the number of bits in your case),
you can easily identify it and resync at that point. For example, with
8 bit characters having one start and one stop bit, the number of bits
per character is 10, so you look for a start bit transition every 160
counts, IE [i] index values of [i], [i+160], [i+320], etc. Note you'll

use 185.18 instead of 160. If the characters are 7 bits, then the
total character length is 9 bits accounting for start/stop, etc.

Since you are operating out of realtime, I think I'd traverse the
array looking only for start bits in one pass. Mark them in an auxillary
array, and then go back and decode each character *after* you've
successfully framed them. That should make everything a lot easier.

>Rather than painstakingly insuring that only messages from ham radio operators
>get out -- which seems overkill to me.

Remember that the station originating the traffic *on the air* is
totally responsible for its content, no matter where, or from whom,
the station gets the traffic. Even checking to see that the message
is from a ham on the internet really doesn't do much to protect
you if you don't manually screen the messages for content before
placing them *on the air*.

The fact that the person on the internet is a ham or not is basically
irrelevant. You're still originating third party traffic, and your
station is responsible for that content. Thus even a PGP sig doesn't
assure you that the message is Ok to transmit. All it can do is assure
you that the sender is who he says he is. If you don't screen the message,
you're trusting that third party with your license.

This is the rub. The FCC doesn't care who typed the message. They
care about who originates it *on the air*. That's you if you are
relaying internet traffic to the packet network. And you are
responsible for its content, just as if you had typed it yourself.
Worse, it is third party traffic, and comes under rules more

restrictive than traffic which you originate yourself.

The first station to put the traffic *on the air* is originating
it from the FCC's point of view. This is the only way that they
can operate, because the third party originating the traffic
on another network is outside their jurisdiction, IE they can't
pull the license of a "Make money fast" poster who doesn't have
(or need) a license in the first place. The only person that they
can hold responsible is the licensee of the station which first
puts it *on the air*.

Now the FCC has already relaxed third party content regulations
about as much as they can without simply opening amateur radio
up to commercial use. Though frankly, I doubt commercial interests
would trust amateur radio networks with their traffic anyway, unless
it were just junk mail advertising, and *we* don't want that cluttering
up our amateur networks.

The purpose of the non-commercial content rules was to protect
common carriers from competition by amateurs. But that's really
pretty silly these days. What the rules do defacto now is to
protect amateur radio from electronic junk mail from commerical
sources. And that's really a good thing. But the FCC really could
just trust us to deal with this and not make a (literal) federal
case out of it.

The sticking point isn't commercialization so much as it is
sexually explicit language. For some reason that sets off the
blue noses faster than anything. The FCC is obsessed with keeping
the "7 deadly words" off the air far beyond reason. This is of
much more concern to them than the occasional commercial junk
mail that might leak onto the amateur networks. Usenetters,
even those who are amateur radio operators, tend to be freer
with their language on usenet than they would be permitted to
be on amateur radio. Thus checking for a license doesn't really
ensure you that some of the "7 deadly words" might not be in
the internet traffic you originate onto the air.

This is the heart of the problem. US society is so hung up
about sex and other bodily functions, and especially about
broadcast descriptions or depictions of the sex act, that we
run into very limiting regulations about how we can forward
traffic onto the air, even if most of it has no sexual content.
It simply gets caught in the net thrown to catch the "dirty"
language. As long as US society is so sick that it will protect
Klansmen and Nazis marching down the street, but will arrest
women for walking down the street nude, we'll have this problem.

Perhaps. But if it is narrowband interference, it wouldn't necessarily
strike channels separated by 33 MHz.

>Actually, Satfacts July '96 has a few good articles on digital sat tv
>troubleshooting, specifically on the EBB on As-2. It's a pity that I am new to
>this field (as a recent user) and a lot of what I read goes over my head at this

>with the high bit-error-rates mentioned in the articles caused by at this stage
>unknown factors but NOT simply terrestrial interference. Perhaps I'm wrong.

Unless there is something wrong with the receiver itself, the problem
is almost certainly external interference or too little signal strength.
Digital TV has a very sharp CNR threshold. Either there is enough signal
for virtually error free reception, or you have a totally bollixed picture.
There is very little middle ground.

It is possible your receiver has a poor noise figure, and thus is near
the threshold. Then slight changes in the signal strength received by
the dish can cause it to fall below the threshold at seemingly random
times. The dish and LNB would seem to be Ok, however, since they work
for an analog signal, and that needs a higher CNR than the digital signal.
But the receiver itself could still have a problem. That likely isn't
the case, however, because you get the same symptoms with and without
the long cable run from the dish to the receiver. That should have
enough attenuation to push the receiver below the threshold if it
is marginal. But the receiver could have an intermittant. The only
real check is to temporarily swap it with one known to work properly.
Perhaps one of your neighbors will let you swap receivers with him
for a day to determine if the problem is in the receiver.

More likely, however, is that the signal is being corrupted by an
external source. Since you don't see the interference on a neighboring
analog channel, the interference must be narrowband. This is where a
TVRO spectrum analyzer can be a great aid. If you can borrow one, they're
often used by TVRO installers, you can have a look at the channel to see
if there is interference present or not. You may be able to identify
the nature of the source of the interference by its spectrum.

Failing access to a spectrum analyzer, you can search for signals
which are harmonically related to the channel, IE something at
2 GHz, 1 GHz, 500 MHz, 250 MHz, 125 MHz, etc (or an odd harmonic
relationship, IE channel/3, channel/5, etc). A scanner can be
used to locate these signals. Of course I hope you've eliminated
possible sources in your own home. For example, have you just bought
a new fast PC, or a Super Nintendo? Could be a harmonic of the processor
clock. Power down everything in the house except the sat system and see
if the interference goes away. If it does, power stuff back up until
the interference returns. The last thing you powered up is the culprit.

If the source is off premises, it'll be harder to locate and identify.
The 5th subharmonic falls in the cellphone band. Do you have a cellsite
nearby? And of course the interference could be the result of an IMD
mix. In that case the sources involved could be virtually anything.

>would be a good band to look at.

6m has a problem as a backbone channel, and that's E skip. As the
sunspot numbers rise, 6m E skip (and even F2 layer skip) is going
to become more common. At the height of the sunspot cycle, TV ch 2
is plagued by skip interference. A 6m backbone would be too.

Of course you could take advantage of this to do truly long haul
forwarding, as is done on HF, but the skip openings are unpredictable
and probably won't be frequent enough for the next couple of years
to make it a dependable linking method.

OTOH, 6m is almost perfect for random meteor scatter. The US government
uses stations operating just below 6m to telemeter snowpack data back
to central receivers via meteor scatter. They run 100 watts into 3-el
yagis, and the path lengths are on the order of what you'd expect from
single hop E skip. There's a meteor along every few seconds with a dense
enough trail to reflect a 6m signal. If the meteor trail is in a common
volume of space with the beams of the transmitting and receiving stations,
a nice strong signal will be received for from a few hundred milliseconds
to a few seconds as the trail dissipates. Using fairly high speed packet
techniques, data bursts can be exchanged all day long.

Ordinary connected mode AX25 isn't very well suited for this, however.
You don't want a go-back-N protocol for this use, and the protocol has
to be able to take advantage of the random nature of the channel. What
the government stations do is transmit continously from the master
receive site. When a remote station receives the signal from the
receive site, it begins transmitting data (on another channel). When
it loses the master receive site signal, it stops transmitting and
waits for the next meteor. The receive site is continously transmitting
an ACK for the last good frame received, and fill requests for any
missed frames, so when the remote hears the receive site signal again,
it knows where to pick up data transmission.

With some (fairly serious) loss of efficiency, one could operate
half-duplex stations instead. One station would "ping" the path
continously, alternately transmitting and listening on a very short
turnaround, and the other station would respond when it heard a ping,

thus commencing data transfer, pausing between frames for an ACK.
We could use AX25 this way if we use short frames, set maxframe to 1,
and retry to forever. An optimized protocol would be much better
though, and the quasi-duplex linking better still.

>Yes, you can filter the signals. With either an analog or digital

Hi, Gary.
I'm agree, you always can do filtering. I meant this is no a good way
to get good enough results, in this particular case.

>BP filter, the envelope which you retrieve out of a BP filter for
>a 1 cycle input is basically the impulse response of the filter.

(I think you mean at least the sum of four impulse responses assuming
square waves...)

>The waveshape isn't the same as the input, but that doesn't matter
>for our purposes here. We just want the energy envelope, and we'll
>get that out of the abs() function.

Yes, the waveshape does not matter, and i said nothing about
waveshapes.

But there is two problems here.
First, the power spectrum for a cycle spreads all over the frecuency
domain, like a big gaussian bell. This mean that the spectrum for a 0
and a 1 are overlapping, and by this reason the filtering gives no
good separation.
Second, on 2nd order filters and above, the filter can have its own
oscilations, with a frequency near that you want to extract. This mean
that the filter can trash your data.

[snip]
>>Do some lo-pass filtering to avoid noise, and detect every tone by
>>simply counting the number of samples (or time) between two upwards
>>zero crosses.
[snip]

>This works with *synchronous* data, but the characters in Caller
>ID are *asynchronous* ASCII. This means you may have an arbitrary
>amount of mark carrier between characters. That throws your framing
>off if you just count cycles.

This also works for *asyncronous* data, it doesn't matter how many
marks carrier you have between characters, because ,correct me if i am
wrong, you will need start/stop bits, so you only have to wait for the
start bit. At last what you get is a bitstream where you throw away
the carrier bits.

If you look close at it, this is only a method detect the instant
period of *half* a cycle. But as i see, it have two advantages.
It is very accurate, provided you do some smoothing on the data and
chose a good threshold.
It is very fast, since it only needs about three or four
multiplications by sample (that can be made with shifts) for
smoothing, and another multiplication if you want more squared waves.
This is a major advantage on *realtime* applications.

As you see, it is only a particular solution to a particular problem,
more based on programming tricks than in signal processing theory.

> it.

We is, with an IC281H. Receive audio from the Discriminator is sent to the
9600 rx port, and normal "speaker" audio is fed to the 1200. The fun is
with the tx audio. On both of the ports we have set the level "high"
and fed tx audio in parallel to the varactor. This does mean that the 1200
baud tones are not pre-emphasised, but even the moaning users have not
yet noticed to complain about it.

The PTT lines for both ports got paralleled too.

> I would also appreaciate if if someone could confirm my wiring by posting the

6575. 2-Meter radio with packet, power supply (F.S.)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-14 00:00:00 UTC
From: Mike <mikeats3@rconnect.com>
Message-ID: <32B2E949.26D7@rconnect.com>
Source record: 32977

Packet system is fully functional, and includes a Macintosh
computers, a TNC, a DC power supply and a two-meter FM radio. Software
and manuals are included.

-------- Package for a total of $400.00 ---------
- Mac Plus 2 Meg memory and built-in 40 meg hard drive
(with keyboard and Kensington trackball)
- AEA PK-232 MBX TNC unit
- KDK 2033 (25 watts) 2 meter FM tranceiver
- "Azden" DC power supply (a look-alike copy)
- All cables for direct plug-in

------ If the Mac is not needed, the price is $275.00 -------

The Azden radio is modified for direct connection to the AEA packet
system.

All cabling is clearly marked, and included.

All related manuals are included for this packet system. All
modifications are clearly documented.

The front panel VOLUME control is independent of the packet's audio
input.

The two-meter radio is rated at 25 watts. It uses solid-state
TX-RX switching, so the overall system is silent in operation, as the
packet system works.

The PK-232 MBX has the most recent ROM upgrade. (I believe the
date is early 1996...)

These units are at my home, in Hampton, Minnesota, USA. The prices
reflect US dollars, and do not include shipping.

Thank you! -Mike K0JTA

6577. PACLEN & TheNet X1J4

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-14 00:00:00 UTC
From: Ron Stordahl <ron@digikey.com>
Message-ID: <32B33729.1FB6@digikey.com>
Source record: 32979

I have seen references to the significance of PACLEN, specifically that on packets to be relayed by TheNet nodes that PACLEN should be limited to 236 bytes. The reason being that TheNet will not send any packets longer than 256 bytes and that it uses up to 20 bytes for needed control information, thus a user should limit himself to 236 bytes when sending a packet so that TheNet node does not have to break the packet into two parts to forward it.

This would only occur on large packets, such as BBS's would send between themselves, in most cases.

Actually 236 bytes is probably higher than most users would set their terminal program to in any case and BBS's might not be set that high unless they have unusually reliable links.

Anyone care to shed more light on this topic?

Ron

Here is what I just set up:
IBM PC computer rescued from a dumpster. 8088 that nobody wants anymore..I put a thrown away 40 meg hard drive in it..Somebody gave me an original IBM monitor that was monochrome. Total cost for the computer: 0
Using a 19 year old Kenwood TR7600 2M radio that I have had since new.
Bought a PK88 TNC for 75.00
Using a Isopole antenna that I had laying around for the last 3 years doing nothing.
Total additional cost; 75.00
The real cost is the time I invest into the project...For instance, I spent all day today putting the antenna up and working out a couple of problems in the TNC interface with the computer and found a bad connector on the TNC cable. Finally at about 9PM at night the project I started at 9AM was up and running...Now I have to learn how it works...

We had the same freq shift problem here with a few of them. It seems to
have a little effect on 9600 baud on margial paths.

By the way, I have wired two of these up to Kantronics KPC-9612's to run
both 9600 and 1200 baud on the same 2 meter freq. Works pretty nice
for that.

I did have on other "minor" problem. My MFJ was on my ringo ranger at
the top of my tower, just above my 3 element tibander. I was running
15 meter ssb one day, unkeyed the mike and the noise level was 10db over
s9. This came from the MFJ somehow. Turning it off stopped the noise.
I ended up putting a tuned cavity in line with the MFJ and cured the
trouble.

Hi Guys,
I downloaded the trial version about 6 months ago and tred it on my
KAM+ (Yes, I downloaded the KA-Gold). It seemed very basic compared
to Pacterm (Program given out by Kantronics), but I decided to try it.
Well, as soon as it started re-programing some of the parameters of my
TNC by itself, I decided to quit the program. I did...and something
caused my TNC to lose all of its parameters...
That left a REAL bad taste in my mouth from this program. Any
advice? I might consider trying it again sometime soon.

>far as I can tell, will only direct the received audio from the side

My understanding, though I have not tested it, is that the transmit
side as selected by the bandsel will take whatever is coming in on the
pkt connector. You can feed the speaker of the passive side receive
in on the mic line in the packet connecter, perhaps.

I'm trying to receive packet on one side for APRS while using the
other side for a phone QSO, and my info is that I must feed the audio
out of the speaker to the TNC, and not use the output of the pkt
connector, as that will have the audio from the active side on it. OF
course, I will not be able to transmit pkt in this configuration.

Yes Brian,
This is a "problem" that needs to be considered any time a person tries
a
different packet program. I find this particularly true when starting
up APRS,
It changes a bunch of params that will mess up TPK or WinPacks' FBB auto
session
properties.
It would be wise to use the 'display' command and save the results in
order to
reset the old params.

: Can anybody tell me from where to get such an EPROM or, much preferably,
: from where one can download the contents of than EPROM ?
: If YES, is there also a manual for that Software ?

Hi,
Firts you have to know wich kind of soft you'll be using ...
Here in Portugal 80 % of our Packet Network his based on
Net/Rom using TheNet , you can get the sources from a ftp site
compile them and get a binary to put on the EPROM.
After that you only need a radio to make a node in a certain
place.
If you want tcpip I would use X1J ...
There are other kind of software but some need computer to work !

You have many info from NORD><LINK , Baycom, Flexnet team in
Germany !!! :)

: Greetings

Merry Xmas !

>Hi, Gary.
>I'm agree, you always can do filtering. I meant this is no a good way
>to get good enough results, in this particular case.

Of course there are other ways to demodulate AFSK. One popular way
is to use a PLL that tracks the input frequency, and use the control
voltage of the VCO as "demodulated data" signal.
This method is used in many integrated FSK demodulators.

The 1200 baud AFSK packet radio modem written for the DSP card 4 by
Jarkko Vuori uses this method. Details can be found on
ftp://wooster.hut.fi/pub/alefnull
The file "doc.zip" contains DSP card 4 documentation and a description
of the modem, "source.zip" has the modem sourcecode.
Beware, it is in Motorola DSP56001 assembly language and you will
probably not be able to make any sense of it when you don't know DSPs.

Symbol synchronization is also covered in this doc and source, but it
is for synchrounous data. I'm not so sure if this will work well for
async data, especially when it is not sent at full rate.

Similar modem software for a TI DSP is also available. Try the TAPR
WWW site for info on their DSP93. (www.tapr.org)

6594. Re: Reviews? MFJ Data Radio

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-16 00:00:00 UTC
From: Ron Stordahl <ron@digikey.com>
Message-ID: <32B587F2.3234@digikey.com>
Source record: 32807

Joe, I don't know what a MFJ1271 is. We have probably a dozen MFJ1270C's which are used in node service (TheNet X1J4), so I am pretty knowledgeable about those.

My point was that the MFJ Data Radio would probably work well for you, but it might be best that you don't look further because if you do you will find that they are very frequency unstable. I found that they drifted about 1KHz during every 1 second long packet. But surprisingly the radios it is communicating with don't even notice (or not surprisingly actualy as the receivers probably have a bandwidth in the area of 5 KHz).

That was my point.

6595. DIN 7/16 ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-16 00:00:00 UTC
From: davem@ee.ubc.ca
Message-ID: <5941l7$uc@frack.ee.ubc.ca>
Source record: 32808
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.antenna

A few questions concerning PCS antennas:

1. I've noticed that many PCS antennas are equipped with DIN 7/16 rather than N connectors. Why?

2. I've also noticed that many PCS antenna specifications now include an intermod spec. Is this spec as measured off the assembly line or at the end of service? (It seems to me that any antenna will exhibit good intermod specs when it's brand new and that performance after exposure to weather is the distinguishing factor. Or have I missed something?)

3. What is the preferred method for measuring PCS antenna intermod characteristics?

Any thoughts or insights would be appreciated.

>I'm agree, you always can do filtering. I meant this is no a good way
>to get good enough results, in this particular case.

Well, yes you can. If you couldn't, then filter mode Bell 202 demodulators wouldn't work. But they obviously do. You can duplicate any analog filter in DSP, so if virtually every leased line modem from the 70s can decode Bell 202 1200 baud signals using analog filters, you can do it with DSP filters too.

The two primary methods of decoding Bell 202 are, with a filter mode demodulator as we are discussing here, or with a PLL demodulator (which is mathematically equivalent if the signal uses coherent FSK). Before cheap VLSI, the primary method used by Bell 202 modems was the filter method. It works.

(And if the signals happen to be non-coherent, it works better than the PLL method, which is why it is still used in higher performance designs.)

>>BP filter, the envelope which you retrieve out of a BP filter for
>>a 1 cycle input is basically the impulse response of the filter.
>
>(I think you mean at least the sum of four impulse responses assuming
>square waves...)

No. Let's look at a FIR filter since it is easier to explain without too much math. A FIR filter is *causal*. That means it doesn't care what came before the start of the signal in time. In the case we have here, there are 18.518 samples per cycle of a 1200 Hz tone. Lets round that to 18 for ease of typing. When the first sample shifts into the filter, the filter's output is what was filtered 241 samples earlier. We don't care what this is, it is non-causal, old news. A multiply/accumulate operation is performed on the sample, and it is shifted down one tap in the filter while the next sample in line enters the filter. This happens a total of 18 times before all the samples for a cycle of 1200 Hz are in the filter.

These samples then march down the filter, having a multiply/accumulate operation performed on each of them at each tap, until the first sample

reaches the end of the filter. *Then* we start to care about the filter output. 241 coefficient operations have been performed on each sample by the time it reaches the filter output. Those coefficients represent mathematically the filter's impulse response. And what we get out of the filter is a signal shaped by the impulse response of the filter.

And that's exactly what we need because we have selected coefficients so that the impulse response is sharply peaked in energy at 1200 Hz while being very sharply attenuated at other frequencies. If we do a Fourier analysis of the output of the filter, it will have a strong spectral line at 1200 Hz, and sharply reduced response at other frequencies. If we *don't* do a Fourier analysis, but instead fullwave rectify the signal with an abs() operation, we get a value proportional to the amount of spectral energy present at 1200 Hz at the filter input 241 samples ago. So the output of the filter is delayed, but it is an accurate representation once that's taken into consideration. Since we are processing a stream where only relative timing matters, a fixed delay isn't a concern.

>But there is two problems here.
>First, the power spectrum for a cycle spreads all over the frecuency
>domain, like a big gaussian bell. This mean that the spectrum for a 0
>and a 1 are overlapping, and by this reason the filtering gives no
>good separation.

No. That would be true for an infinitely narrow impulse. That's an analytic tool we use in developing coefficients for the filter. But that isn't what we see for a single cycle of sinewave 1200 Hz sampled above the Nyquist limit, which is the case here. A pure sinewave, by definition, contains energy only at a single frequency.

Only if we were sampling below the Nyquist limit would we see something approaching classic analytic impulses. (The sample clock itself, embedded in the data, does appear to be an impulse, and would produce the unfortunate sort of response you note, but we avoid that by having anti-aliasing filters in the A/D (built into the sound card codec) and reconstruction filters in the output (in this case our envelope smoothing filter serves that purpose). Since the sample rate is displaced a long way from the mark and space tone frequencies, IE sample clock is 22 kHz, these filters can be relatively simple.

>Second, on 2nd order filters and above, the filter can have its own
>oscilations, with a frequency near that you want to extract. This mean
>that the filter can trash your data.

This is an area of concern when designing IIR filters. Because IIR filters are non-causal due to feedback, instability can occur if you haven't done your homework and chosen coefficients which keep the poles and zeros in the unconditionally stable portions of the unit circle on the z plane. Because of this, causal filters like the FIR are preferred over the IIR when stablity has to be guaranteed

in a cookbook design. But the computational cost of the FIR filter
is much higher than for the IIR filter when sharp responses are
required. So we use the IIR filter, but take pains when choosing
coefficients to make sure it will be unconditionally stable over
the range of interest.

There may still be errors at the head and tail of the sample
stream for a brief input, IE ringing, but for relatively low
order IIR filters, IE order less than the number of samples
per cycle, we can mostly ignore that in a digital demodulator.
We couldn't ignore it in the analog signal case since we'd
hear the distortion, but because we sample the signal in the
middle of the eye to make a 1 or 0 decision, we can ignore
the distortion in the eye tails. Note this implies an accurate
data clock (data clock, not to be confused with the A/D sample
clock, which is an altogether different thing). This is what
the 16x digital PLL I described earlier provides.

>[snip]

>wrong, you will need start/stop bits, so you only have to wait for the
>start bit. At last what you get is a bitstream where you throw away
>the carrier bits.

Yes. I keep forgetting that this is not a realtime demodulator. When
you can traverse the array as many times as you like, you can locate
the start bits and frame the characters before you start to decode
them. But in realtime, you can't do this, so you have to have a
reliable pacing clock, from some external reference, or derived
locally by one of several techniques, the preferred one usually
being a digital PLL.

>If you look close at it, this is only a method detect the instant
>period of *half* a cycle. But as i see, it have two advantages.
>It is very accurate, provided you do some smoothing on the data and
>chose a good threshold.
>It is very fast, since it only needs about three or four
>multiplications by sample (that can be made with shifts) for
>smoothing, and another multiplication if you want more squared waves.
>This is a major advantage on *realtime* applications.

No, it is a major advantage for non-realtime use. In realtime, you're stuck with a causal sequence and can't back up. So you don't know you've found a start bit until it is too late to discard any intervening idle marks you may have already attempted to decode. A memory-less decoder cannot be made to function with this scheme because there is no way a priori to know how long an idle mark condition may persist (it could last for *days*). You need memory in the decoder at least 2 character times deep, a pacing clock to measure when 2 character times have passed, and some decision logic to implement discarding idle marks in pseudo-realtime. (Now that's usually not very costly, but it does double the chances of errors in decoding caused by noise pulses which mimic transitions which don't really exist in the data, and that represents a 3db SNR impairment we'd prefer not to pay.)

And actually, the SNR price we pay for using zero crossings as the decision point is much worse than that. A zero crossing is the zero energy point of our signal. CNR is minimum at this point. If we use the center of the eye as the decision point instead, we have maximum CNR. In practice we detect a zero crossing by doing a differentiation of the waveform, looking for the point where the slope is maximum, but noise corrupts this differentiation, and causes fairly large amounts of "jitter". This leads to further decision errors at a compound rate. We can remove some of this jitter with an envelope smoothing filter, but we're playing a losing game. As CNR degrades, we find the corner frequency of the smoothing filter must be moved lower and lower, which effectively limits our baud to a lower and lower value. This is very costly in terms of system performance.

Gary

>
>This is my doubt. ANY HELP is welcome.

I don't know of any amateur HF radio today that has internal data mode
decoding. Their serial ports are just for controlling the functions
of the radio remotely. To decode received data, you need a data
decoder of some kind which is fed audio from the receiver. In
some cases, you can use your computer's sound card and some software
to decode the data, in other cases you would use a separate hardware
decoder box which attaches to the radio audio in and out connections
and connects to the computer by a RS232 serial link. These boxes
have various names. Those for RTTY are called TUs. Those used for
packet are called TNCs. Those which do many different modes are
called, unsurprisingly, multimode controllers.

Decoders can range from very simple to very elaborate. Often, but
not always, the very elaborate ones work best.

Source record: 32811

Brian,

I think you saw something for the 232, not the 2232. AEA sent out the upgrade EPROM's shortly after the they officially went out of business. It says something good about Mike Lamb that he made a real effort to do this.

PRINT THIS ARTICLE RIGHT NOW!! YOU'LL BE GLAD YOU DID!

HI THERE...Would you like to make thousands of dollars quick and

legally?

Then keep reading...please take five minutes to read this article. It

will change your life. It's true!

You can make up to or OVER $50,000 dollars in 4-6 weeks, maybe sooner!

I'M NOT LYING TO YOU AND THIS IS NOT A SCAM! If you're interested, keep

reading; if not have a nice day.

I was browsing around the newsgroups not too long ago(just like you are

right now) and I stumbled across this article. Since it had to do with

making money which I NEVER pass on, I decided to give it a try. This is

what it said:

A while back, I was browsing through newsgroups and came across an

article similar to this one that said you could make thousands of

dollars

in weeks with an initial investment of only $5.! So, I thought "Yeah,

right, must be a scam." I was curious like most, so I kept reading. It

said to send $1. to each of the 5 names and addresses listed in the

article, then to place my own name and address in the article at the

bottom of the list at #5. Then post the article in at least 200

newsgroups(there are thousands).

After thinking it over, I decided to try it. I figured that all I had to

lose was $5. and some stamps right? Someone who tried it says:

"I started getting money in the mail! I was shocked! I figured that

it woud end soon and did'nt give it another thought. But then the money

kept coming in...tripling in size and multiplying by ten to TWENTY times

the amount that I recieved the first week! In my first week I made about 20 - 30 dollars. By the end of the second week, I had made over $1,000! In the THIRD week, I had over $10,000 dollars and it's still growing!! This is my fourth week(Oct.11) and I've made about $42,000 total and the money is STILL coming in..."

Let me tell you how this works and most importantly, WHY it works. Please make sure you print a copy of this NOW because you may not remember how to find it again. This will be ALL you need to know in order to start making MONEY. The process is simple and it consists of 3 EASY steps.

STEP 1: Get 5 separate pieces of paper and write the following on each sheet; "PLEASE PUT ME ON YOUR MAILING LIST." It's also a good idea to put on that same paper the number of the person you got the article from. Get five $1. bills and place ONE inside each piece of paper you just wrote on and fold each piece of paper so the bill will not be seen through the envelope(otherwise, weasels who like to steal envelopes with money in them will get yours). Put one paper inside the envelope with a $1.bill and seal it. Do the same for all 5. You should now have 5 envelopes sealed, each with a piece of paper AND a $1. bill stuffed inside.

Make sure those words that were stated above are on each paper. What you are doing is creating a service by this. IT IS PERFECTLY LEGAL. Now then, mail the five envelopes with the paper and $1. bills in each to the following five addresses:

(1) M. Hablabi
American University of Beirut
850 Third Avenue, 18th Floor
New York, N.Y. 10022
Box 1467

(2) A. Munsterteiger
12078 E. Clinton Street

Scottsdale, AZ 85259

(3) P. Bellone

12010 North 114th way

Scottsdale, AZ 85259

(4) C. Cracraft

2504 Larkin Road #103

Lexington, KY 40503

(5) Joe James Connolly

118 Etling Avenue

Goose Creek, SC 29445

STEP 2: Now take the #1 name OFF the list that you see above, move the other 4 names up one each(5 becoming 4, 4 becoming 3, etc.) and put YOUR NAME as #5 on the list. You can slightly alter this article if you need to edit some information.

STEP 3: Post your amended article(with YOUR NAME at #5)to at least 200 newsgroups(there are THOUSANDS). All you need say, is around 200.

HOW TO DO THIS: If you have NETSCAPE 3.0 do EXACTLY the following:

1) Click on any newsgroup like normal, THEN click on 'TO NEWS' which is on the far left when your in the newsgroups page. This will up a box to type a message in.

2) Leave the newsgruop box like it is but CHANGE the Subject Box to something flashy like "KING CASH$$ READ HERE$$$ or "BIG $$$"!!

3) TAB once and you should be ready to type. Now, retype(ONLY ONCE)THIS WHOLE article WORD FOR WORD except to insert your name at #5 on the list and remove #1 off the list, plus any other small change you need to make. Keep almost all of it the SAME!

4) When you're done typing the WHOLE article, click on 'FILE' in THIS BOX right above SEND. NOT WHERE IT SAYS NETSCAPE NEWS ON THE FIRST BOX. Click on 'SAVE AS' when you're under 'FILE'. Save your article as a text file to your C: or A: drive. DO NOT SEND OR POST YOUR ARTICLE UNTIL YOU DO THIS. Once saved, move on to #5 below.

5) If you still have all your text, send or post to this newsgruop now by just clicking 'SEND' which is right below 'FILE' and right above Cc:.
6) Here's how you're going to post all 200. OK, click on any newsgroup then click on 'TO NEWS'(again in the top left hand corner). Leave the NEWSGROUPS BOX alone again but put a flashy subject title in the SUBJECT BOX, hit TAB once..you're in the body of the message. Then click on ATTACHMENTS which is below the subject box. you will get another box to come up. Click on ATTACH FILE then find YOUR file that you saved. Click once on the file and the click 'OPEN'. Now click on 'OK'. If you did this right, you should see your file name in the attachments box and it will be shaded green.
IF YOU USE IE EXPLORER: It's just as easy. Holding down the left mouse button, highlight this article. Then press the "CRTL" and the "C" key at the same time to copy this article. Then print this article for your records to have the names of those you will be sending $1. bills to.
Next go to the newsgroups and press "POST AN ARTICLE". A window will open. Type in your headline in the subject area and then click in the large window below. Press "CTRL" and then "V" and the article will be placed in the window. If you want to EDIT the article, do so and then highlight it and copy it again. Now everytime you post the article in a new newsgroup, all you have to repeat is "CTRL" and "V" and press post.
7) That's it!! Each time you do this, all you have to do is type in a different newsgroup, so that way, it posts to 200 DIFFERENT newsgroups. YOU SEE? Now you have just 199 to go!(Don't worry, one takes about 30 seconds once you get the hang of it). Remember, 200 is the MINIMUM. But..
the more you post, THE MORE MONEY YOU WILL MAKE!
You are now in the mail-order business and will start recieving your $1. envelopes from varioys people all over the world within days. HINT: The more newsgruops you post to, the more money you will make. You may want to eventually forward your mail to a P.O. Box because of all the mail.

If you wish to stay anoymous, you can come up with a name such as "INVESTOR" or "MANAGER". Just make sure all the addresses are CORRECT...PLEASE.

LET ME TELL YOU WHY THIS SYSTEM WORKS>>>

Out of every 200 postings, let's say you ONLY recieve 5 replies, which is actually VERY LOW. So you make 5 dollars with my name at #5. Now then, each person who just sent me a dollar makes, say only 200 postings. Now with your name at #4, WHICH IS A TOTAL OF 1000 POSTINGS not including yours too. 50 people send you $1. now; that's $50. you just made.

NOW>>>>>>>>>>

then you 50 agents 200 each with your name at #3. That's 10,000 POSTINGS (50X200). Average return is 500 at $1. each is $500.

They make 200 postings, which is 5,000 returns at $1. each which comes out to $5000.! And finally, 5000 people make 200 postings with your name at #1. You could now get a return of $50,000. BEFORE YOUR NAME DROPS OFF THE LIST. That's if EVERYONE MAKES ONLY 200 POSTINGS AND IF ONLY 5 PEOPLE RESPOND!!!

When your name is no longer on the list, just take the latest posting that's appearing in the newsgroups and repeat the whole process(except for retyping this article because it's already in your system's memory!)

The thing to remember is, do you realize that THOUSANDS OF PEOPLE ALL OVER THE WORLD ARE JOINING THE INTERNET AND READING THESE ARTICLES EVERY DAY...JUST LIKE YOU RIGHT NOW??!!So...can you afford $5. to see if it really works? I think so.

People have said; "What if the plan is played-out and no one send you the money?" SO WHAT?! What are the chances of that happening when there are TONS OF NEW, HONEST INTERNET USERS who are joining the internet and newsgruops every day and willing to give it a try? Estimates are at 20,000 to 50,000 new users EVERY DAY with thousands of those actually jioning the internet.

Remember...PLAY FAIRLY and HONESTLY and thi will work! You just have to be honest! Make sure that you've printed out his article and try to keep a list of everyone who sends you money. Keep an eye on the newsgroups to make sure everyone is playing fairly.

HONESTY IS THE BEST POLICY. You DON'T need to cheat the basic idea to make money. IT's ONLY FIVE DOLLARS!!

GOOD LUCK to you and please play fairly by sending your money to the five names on the list. You will then reap the HUGE rewards from this which is TONS OF EXTRA CASH!!

This is the most fair and honest way I have EVER seen to share the wealth of the world without costing anything but our time. GOOD LUCK!!

6601. RE: 6M Packet Activity

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-16 00:00:00 UTC
From: wb9mjn@wb9mjn.ampr.ORG
Message-ID: <11678@wb9mjn.ampr.org>
Source record: 32993

Hi,

The biggest impediment to 6 meter packet backbones is Impulse noise. The 9600 baud technigue we use, is .5GFSK. .5GFSK does not share the impulse noise imunity of FM Voice. Each impulse makes a bit in the packet a 50/50 coin flip. At 9600 baud, packets can see 2 or 3 impulses, and that drops the packet probability of copy down to 1/4 or 1/8th. The recently implimented 1/2 rate FEC in the newer version of the DSY modem could solve this. But, that makes the expense greater than 9600 baud links on 440, for only 19.2 KB legal baud rate. Additionally, 6 meter energy is more expensive to focus. So, for linking, there s allot of wasted RF, and coordination problems in areas that use 6.

6 is used in areas where the population is clustered, with low population areas inbetween. Such as inland Southern California, and neighboring states. Here, low noise sites are available. In the Eastern U.S., where there is human activty evenly distributed, its more dificult to find a impulse noise free site.

6 Meter Packet Meteor scatter is a good bet for areas without mountains, and sparce population. Say, like North Central Canada. With mountains, long range links are easily done on higher frequencies. Sparce population reduces thru-put requirements, and coordination difficulties. Geostationary Satellites are also expensive to access in an area such as North Central Canada.

Full Duplex, with FEC , and .5GFSK would work for meteor scatter. But, full duplex is really expensive , and bulky at these low frequencies. Simplex might be made to work, with DSSS. The BW of the reflection should be broad enuf support DSSS. And DSSS with phase related chip and bit rates have available chip sets for lockup within one symbol time. This would allow an almost waste free turnaround, with appropriate protocolls. AX.25 really is not very efficient in simplex, and I would only recomend full duplex meteor scatter using ax.25 protocoll. A better link level protocoll would be needed for simplex meteor scatter. One that would allow "fills", without complete multiframe packet retransmission. DSSS would make simplex meteor scatter a worthwhile thing to pursue. Simplex technigues should also have FEC.

73, Don.

Does anyone have a packet list for Alaska? Specifically the Dutch Harbor/Unalaska region, as I am going to be in and out of there quite a lot next year.

-thanks

6604. DSP-232

Newsgroup: rec.radio.amateur.digital.misc

Source record: 32996

I was surprised to recently receive an upgrade set of ROM's for the DSP-232 from AEA. However when I installed them I found what appears to be a bug. In the PACTOR mode when the "OVER" is sent (CNTRL Z) apparently the AMTOR "OVER" (+?) is sent instead. The new ROM's were marked Version 1.0 L31. Does anyone have any information? Is there a source for upgrades on the ROM's for the DSP-232?

Thanks and 73,

Jim

Subj: RE: wonder if this is true or if its like that sick boy awhile ago

This one is genuine. A quick check to www.hmco.com found this:

In The Polar Express, following a magical train ride to the North Pole,
a young boy discovers that only those willing to believe can hear the
sound of the sleigh bell Santa Claus has given him. The campaign
translates the book's sense of wonder and message of faith into an
invitation to help children who can't be home during the
holidays.

To participate all you need is a free minute or two to post a message
on this site and, like the young boy in The Polar Express, the
willingness to truly believe in the spirit of the season. For every
25 messages received, HMI will donate a copy of The Polar
Express or another children's book to a children's hospital.

Our goal this year is to receive 50,000 messages,
TWICE the goal we set in 1995. So join the campaign,
share the spirit and pass this URL along to anyone else who's
willing to share!

Send a message now and help us reach our goal! Or browse messages
to read what fellow campaign contributors wrote.

As of Wednesday, December 11, 1996,
The Share the Spirit Message Count is 50,000!!

6606. NWQterm source code available

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-16 00:00:00 UTC
From: oh3nwq@nic.funet.fi
Message-ID: <593h54$v0s@nic.funet.fi>
Source record: 32998

You can download the source code of NWQterm from
http://www.geocities.com/CapeCanaveral/3491/index.html

It is a packet radio terminal program for a BPQ node.
It features:

Listeng to DX cluster forward traffic and saying
the DX spots on a sound blaster compatible card.
Compressed download from a FBB bbs.

and probably more functions as I made this
program for my own use a couple of years ago.
As I am not so active on packet radio anymore,
I decided to give this source code (written in Turbo Pascal 7.0)
to the public domain.

>Oh! My? $$$$
> THIS IS THE FAIREST MOST HONEST WAY I KNOW TO SHARE THE WEALTH! Hello!
>(Save this file now...it will save you some time typing later if you
>decide to try this)
> Would you like to make thousands of dollars, quick, legally, with NO
> CATCH? Then keep reading....please take five minutes to read this
> article it will change your life, just like it did mine. It's true!
> You can make up to or over $50,000 dollars in 4-6 weeks, maybe sooner!
> I SWEAR I'M NOT LYING TO YOU, AND THIS IS NOT A SCAM! If you're
> intrested, keep reading; if you're not, I apologize for wasting your
> time.
> Here we go. A little while back, I was browsing through these
> newsgroups, just like you are now, and came across an article similar to
> this that said you could make thousands of dollars in weeks with only
> an initial investment of $5! So, I thought, "Yeah, right, must be a
> scam", but I was curious, like most of us , so I kept reading. Anyway,
>it
>said that you send $1 to each of the 5 names and addresses stated in the
> article. You then place your own name and address in the article at
>the bottom of the list at #5, and post the article in at least 200
> newsgroups (there are thousands). No catch, that was it!
> So after thinking it over, talking to a few people first, I tried it.
> I figured what have I got to lose except for 5 stamps and $5, right?
> Well, guess what...within 7 days, I started getting money in the mail!
> I was shocked! I still figured it would end soon, and didn't give it
> another thought. But then money kept coming IN, tripling in size and
> multiplying by 10-20 times the amount that I got the first week! In my
> first week I made about 20 to 30 dollars. But by the end of the second
> week, I had made a total of over $1,000!!!! In the third week, I had
> over $10,000 dollars, and it's still growing. This is my fourth week
> (Oct 11) and I've made about $42,000 TOTAL, and the money is still
> coming in.....
> Let me tell you how this works and most importantly, WHY it
> works...also, make sure you print a copy of the article NOW, so you get
> the information off of it, and begin making money.
>
> The process is very simple, and it consists of 3 EASY steps:
>
> STEP 1: Get 5 seperate pieces of paper and write the following on each
> sheet of paper..."PLEASE PUT ME ON YOUR MAILING LIST. YOU ARE NUMBER
> 5." (etc. to number 1) Get five $1 bills and place ONE inside each piece
>of paper that
>you just wrote on, and fold each piece of paper so the bill will not be

>seen in the envelope (otherwise, nosey people who like to steal envelopes
> with money in it will get yours). Put one paper inside the envelope
>and seal it. Do the same for all 5. You should now have 5 envelopes
> sealed, EACH have a piece of paper AND a $1 bill stuffed inside of the
> paper. Make sure those words that were stated above are stated on each
> paper. What you are doing is creating a service by this, this is
> PERFECTLY LEGAL. Now then, mail the 5 envelopes with the paper and $1
> in each to the following 5 addresses:
>
>
>1. P.DEBOUZY, 9 rue des Lavandieres, 78530 BUC, FRANCE.
>2. PO box 196, Riga-67, LV1067 Latvia EUROPE.
>3. P. Rae, 209 Oak Butte CT., Folsom. California. 95630. USA5.
>4. M. Rapp, 801 Mockingbird Ct., Hinesville, GA 31313 USA
>5. J. Rhodes, 5011 Stoneview Dr., Charlestown, IN 47111
>
>STEP 2: Now take the #1 name off the list that you see above, move the
>other 4 names up (5 becoming 4, 4 becoming 3, ect.) and put YOUR NAME
>as number 5 on the list. You can slightly alter this article if you need
>to, editing what you need to edit.
>
> STEP 3: Post your amended article (with your name at #5) to at least
> 200 news groups (I think there are close to 18,000 of them). All you

Martin Rath (Martin-Rath.fa1ukp@wanadoo.fr) wrote:
: My question is : How does it works ???

Hi Martin ,
Well ,to put baycom working with Linux you must get the AX25-HOWTO (latest),
thats the best way to configure it !
Try kernel 2.0.14 and up , compile the kernel to support baycom module and
other options like SLIP , radio applications , etc ...
Then get the lastest ax25 utils and install them , atfer that you attach the
radio port and define the routing table .
In my script i have :

setserial /dev/ttyS0 uart none (ttyS0 = COM1)
axattach /dev/bc0 baycom (baycom it's the port defined in /etc/ax25/axports)
ifconfig -i 44.158.38.4 sl0 (Don't know if it's correct but assign an ip to
the baycom port known for linux as sl0)
route add -net 44.0.0.0 sl0 (This will route all 44.x packets to baycom)

You could do a better routing table but if you have a dedicated machine for
packet it will work ok ! :)

I had problems with my UARTS , so if you have an 16550A and Linux crashes at
axattach just try with other UARTS , I installed two more serial ports with
16450 Uarts and baycom now works fine ....

Actually the KPC-9612 will work well with ONERADIO ON using the
TM-733. Simply connect the transmit audio (TXA) from both the 1200 and
9600 ports of the KPC-9612 together. Connect both receive inputs
together, both PTT lines, and both grounds. These connect to the
TM-733 on the mini-din connector. The receive signal from the TM-733
should be from the 9600 baud receive pin, NOT from the 1200 baud pin.
Be sure the radio is set for 9600 baud.

Also set the CD command to SOFTWARE in the KPC-9612, and adjust the
drive level from BOTH ports to achieve approximatelly 3 kHz deviation.

Hmm, maybe PGP could be used to to validate the originator of commands
going to a remote base station. You send a command, with an index # to
the remote base along with a PGP signature. The computer on the remote
base side validates with the key and wala' an pretty secure remote base.
Is this practical?

6616. Simple questions on HF Pactor

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-17 00:00:00 UTC
From: Rich Abbot <abbot@pez.bell-labs.com>
Message-ID: <32B6F8C9.22CF@pez.bell-labs.com>
Source record: 32819

After a year of AX.25 on 2 meters, I wanted to try some digital operation on HF. My TNC (an MFJ-1276) can do HF Pactor, so last weekend I decided to tune around, trying Pactor for the very first time.

I don't know what Pactor sounds like, but I did find lots of digital signals around 7.090 and 14.100 that were definitely not RTTY. I tuned in each one I encountered, made sure I was "dead on" with the MFJ's tuning indicator, saw my DCD light flicker and go bright, and watched my screen. Nothing.

I thought that I might be listening to HF packet, rather than Pactor, so I took the TNC out of Pactor mode and tried tuning through again on each band. Nothing on my screen.

All told I spent about 2 hours sweeping the low ends of 20 and 40 meters, with not a single byte of received data to show for it. I must have tuned in about 20 different digital signals during that time.

So I'm wondering...

- is Pactor operation rare, or is it reasonable to expect to find some activity on 40 or 20 during US daylight hours?

- what are the hottest spots/times for Pactor ops?

- can one tell by ear if there is Pactor activity present, or do you have to tune through with a TNC to tell?

- is there something else I forgot to do that enables Pactor decoding? My MFJ manual basically says "tune to center and watch the screen."

- if what I heard was not Pactor, what was it? Are the other HF digital modes like Clover much more popular than Pactor?

If there is a beginner's reference for Pactor operation, I'd love to know about it. Most packet and "intro to digital" books cover VHF packet, with only a little info on HF operation.

Thanks for any advice!

It seems that, given strong authentication (e.g., PGP or DSS) and an
assertion by the licensed originator that the message conforms to
Part 97 (perhaps a new MIME spec), one could start to argue for a rule change.

Or, maybe not...

The 7/16 DIN is suposed to have a lower loss than an N connector. I
have not seen any evidenace but thats the story,
Oh, It will handle more power but thats a moot point at 1850 to 1990
Mhz. Its interesting to note that the N connector is use used inside
the Base station and the DIN is used outside.

I cannot help you with the Intermod ratings, I will have to look into
that tomorrow and see what the antennas we are using are rated at.

I have a Texas Instrument laptop running windows 3.11. Problem with baycom is L2 is not running, that is I do not get the flashing icon in the upper right hand of the screen as mentioned in the text files. Radio is an ICOM ht, it transmits and receives ok hooked to the baycom but will not connect. Can anyone help with suggestions. My pk232 works fine on this radio and computer. Thanks David VA3MRJ

Hi,

I am thinking of trying to make a small, portable packet rig using
an HP48 as the terminal. Does anyone have any experience with this?
I plan to use a 2m HT as the transmitter, and am looking for some
advice on a small, inexpensive TNC that will work with the HP48.
I am currently using a KPC-3, but would like something cheaper,
and possibly even smaller. Any ideas?

Thanks...Win

You may have another problem you do not suspect! I bought the Baycom
TNC for sampling it and did not use anything but the software that was
supplied with the little modem. It was clean.

I had two other versions of the Baycom code on my BBS for download. Both
were proper shareware or whatever. It turns out that one of them came
off a D&M CD PRODUCTION disk that was titled simply BAYCOM.ZIP, which
had the L2.EXE file in the .ZIP apparently infected with the following virus.

FRODO.FISH_6.A Virus CRC-32 Checksum 29ee57c3

The file is approximately 24K larger than the correct file. The correct file
version of L2.EXE appears to be dated 12-94-91 @ 01:50 and shows a
CRC Checksum of 21c97a1d. That correct file came out of another version
of this same software entitled BAYCOM15.ZIP, which arrived as an auto FTP
update version to BAYCOM14.ZIP to my BBS. Memory says L2.EXE in clean
form is around 24K in size. When infected it is about 48K in size. For
grins, I tried to clean it off a floppy, the .EXE shrank to about 20 bytes...

:)

I realize this is an old file, but the little modem is inexpensive, floats around
a lot in hamfests and so on. It seemingly gets picked up without software
and thus even the older stuff appears imoortant for it at times.

I'd scan my system for this one, if you like. McAfee didn't stumble across
this one until the September 96 data list! The file had been sitting there
and never used on one system I had, scanned nightly all these years. When
the September data came around, POOF! There it was!

I have no idea what FRODO.FISH_6.a does and don't have the time to set
up a box just to figure it out. Your mileage may vary!

> not RTTY.

Rich... most Pactor on 40 is between 7.070 to 7.080. On 20, it's between
14.070 to 14.080. When the bands are open there is *lots* of activity.

It sounds like chirping. If you can hear both stations in a QSO, you will
hear a repeated series of long chirps with short chirps between the long
ones. If you can hear only one station, you will just hear the long or the
short chirps. The long chirps are the ones that you will see displayed as
text on your screen.

Pactor stations call CQ in something called FEC mode. That sounds something
like fast RTTY and does not have the 'chirping'.

>
> - is there something else I forgot to do that enables Pactor
> decoding? My MFJ manual basically says "tune to center and
> watch the screen."

Make sure you have typed MODE PACTOR at the cmd: prompt. Otherwise, just
tune for the led to be in the center (plus or minus one LED). Also, make
sure that the pushbutton on the back of the TNC is in the right position
(one position is for 1200 baud, the other is for HF modes).
>
>
> If there is a beginner's reference for Pactor operation, I'd love

The ARRL has something called the HF Digital Companion. I have not read it
though, so I cant comment on how good it is.

Keep trying, Rich. It's a terrific mode. It's amazing how you can have
error free communication even with very low power.

That's one approach. It would require a rules change, however. Phil
Karn attempted to get the FCC to reconsider their regulations on
forwarding a while back and was denied. I don't think the FCC has
a good grasp of how these systems really work.

Anyway, there is another way. You can allow the internet operator
to temporarily "borrow" your station, and orignate traffic from
it. This gets around the third party limits and places his license
on the line instead of yours.

The way this works is that the internet operator logs into your
system with an encrypted verification such as the PGP sig and
is assigned temporary control of the station. *His* call sign
is temporarily put on the station, and he operates it as his
station, operating under remote control. This is legal under
current rules.

This is ugly, and effectively limits the station to handling one
operator's traffic at a time. It also really screws up packet
routing algorithms and ARP caches. But it can be done.

Jason,

At the CMD: type PBBS 15 That will increase it to 15K. That should hold a little more. If you are looking for more space for about $30 you can get the 128K Memory chip and increase the mail box to over a 100K.

Win,
You could look at the BayCom TNC's, or , there is one advertised in CQ
that is inside of a DB-25 RS-232 connector. Personally, I would stay
with what you presently have. I use a KPC-3, TI Extensia 515 Notebook
Pentium 100 computer & Icom HT for portable packet.
73's & Merry Christmas.

At the risk of appearing excessively pedantic, I might observe that:

- transmitter fingerprinting identifies the transmitter, while
strong authentication identifies the originating person; and

- there are [sort of, and will be good] good ways to distribute
information about authentication keys, while I haven't heard
of a good, indexed database of transmitter fingerprints.

. (A lot of people are working building infrastructures
to distribute, for example, public PGP keys. Interesting
issues include: How do you know that a particular public
key _really_ is associated with a specific person? or,
How do I know that I _really_ received good information
from what I think is a trusted source of information?)

. (Perhaps, constructing a database of transmitter
fingerprints would make a good research topic for someone.)

You can expand the standard 32K ram to 128K, by just swapping out
the chip.

If you are willing to cut a trace and solder in a jumper, then you
can go up to a 512K ram chip.

I'm posting this for Mark, W0BG (ex-WK0V), who has no access to this newsgroup. The reply-To address is Mark's.

Mark has an AEA PK-232 and uses AEA Log Windows in Windows 95. Mark has installed the ability to change keyboards in Windows 95 and has immediate access to umlauts and other accented characters, but they don't seem to work with his Log Windows/PK-232.

The umlaut will appear on his Log Windows screen, but is always translated to some other character before it reaches its destination - even when he just sends a test message to himself. Messages from his packet radio correspondents in Europe with special characters come through and are displayed in Log Windows without a hitch.

In the absence of any tech support from AEA I am posting this appeal for help for Mark here. Can you shed any light on what is happening here and/or how to send the umlauts?

Thanks es vy 73,

>Bob K7IQ

Maybe, though my superstition would be that having a remote base automatically verify a transmitter fingerprint is a pretty sticky problem. Like you'd have to filter out noise an other stuff. Take into account weird propagation effects. And, what if a legit user replaces a transister somewhere.

Seems with a laptop or small pc at a remote sight, you could write a program that reads in the data from the TNC or whatever, then execs out to call PGP to verify the signature. It just means a bit more hassle on both ends to make the proper signature.

(Though I'm a programmer, so I tend to see programming solutions as feasible and analog solutions as tricky -- I do think this IS actually the case here.)

>No, but it uses 1200 and 2200 Hz and is half duplex only.

A genuine 202 has a 5 bit per second reverse channel which was typically
used to send interrupts back to a host CPU. The typical AX25 setup
abandons all of the 202 standard except for the forward (1200-1800) tone
frequencies.

I think this would really useful. We modify the rules so for unsigned traffic the rules remain the same. But, for traffic signed with a key verified at, like, an ARRL/TAPR key database, and clearly marked as being for distribution by ham radio by the originator, then the originating call would be responsible for the content.

Hams would have to be responsible for keeping their private keys secret. That's because if someone uploaded child pornography to the system with their key, then they would be liable. If someone consistently abuses the system, we pull their call from the database and then they can no longer send any packet traffic. Neat.

This would fix the unworkable rule that every call of every packet box along a chain is responsible for the content of every message. This makes every packet BBS operator liable, I think, in a way that's completely unreasonable. I think it
stifles the development of packet.

You must be running several nodes as the 32K chip can handle 1 node and around
20K for a mail box. I have the 128K chip, which gives a 100K mailbox. You can
also get as much as 512K for memory in the KPC-3.

I don't know how AEA implements umlauts, but you might try turning off
huffman compression since the umlauts (in IBM) are above ascii 127. Also
make sure your serial interface is 8-bit.

The receivers work fine, just remember that the discriminators have
a DC offset.

The transmitters present a bit of a problem. They use phase modulation,
not direct FM. That won't do. You can modify the Icom and modulate the
temperature compensation input, but a better way is to convert to a
Motorola channel element. It is designed to accept direct FM modulation.
All you need do is devise an adapter to mate the pins, the GE Icom and
the Motorola channel element have different pinouts.

>there s allot of wasted RF, and coordination problems in areas that use 6.

I think what you meant above is that the expense is greater than 56kb
on 70cm. You're right, at least on a per bit basis. FEC can be done in
software on the PC instead of in the modem, however, but you're still
limited to 19.6 kb on 6m. If you use plain FSK, cost is lower than
using a downspeeded 56 kb modem, but it becomes a bandwidth hog that
we really can't justify on 6m, especially with the sunspots on the
rise and the explosion of Techs appearing on 6m for a taste of skip
propagation. We can't claim large amounts of exclusive bandwidth for
packet here.

> 6 is used in areas where the population is clustered, with low population
>areas inbetween. Such as inland Southern California, and neighboring states.
>Here, low noise sites are available. In the Eastern U.S., where there is
>human activty evenly distributed, its more dificult to find a impulse noise
>free site.

Well, not all of the Eastern US has a uniform distribution of amateurs,
especially amateur packeteers. In the South, we have what we laughingly
call mountains, but they are really extended ranges of hills. This sort
of rolling terrain is difficult to cover on UHF when you need to make
fairly long hops and there's no amateur in between who'll host a relay
site. This is a problem for connecting amateur population clusters. We
wind up with a few amateurs driving many many miles maintaining a series
of unattended relay sites on Forest Service property. It would be an
advantage to be able to do longer hops to reduce the number of relay
sites required. Likely that would more than equalize the cost differential,
and certainly would reduce maintenance requirements.

Note, however, that I'm not convinced that, excluding MS or skywave
for the moment, 6m is really a longer range band than 70cm or 219 MHz.
Beyond LOS, they all depend on some form of scatter. We can stack
enough more antenna gain at UHF to make up for any advantage 6m may
have for ordinary (but not MS) forward scatter propagation. Glenn Elmore
did a paper which appears to show that if you have to depend on forward

scatter, you might do better going *up* in frequency rather than down.

> 6 Meter Packet Meteor scatter is a good bet for areas without mountains, and
>sparce population. Say, like North Central Canada. With mountains, long range
>links are easily done on higher frequencies. Sparce population reduces thru-
>put requirements, and coordination difficulties. Geostationary Satellites are
>also expensive to access in an area such as North Central Canada.

I think that much of the Plains States and the rural South also qualify
as areas where 6m could be gainfully employed. And, a 800-1200 mile hop
distance (MS) would reduce network *latency* dramatically over a series
of UHF links spanning the same distance *anywhere*. This is the real
advantage of 6m MS, it offers the opportunity to lower the hop count
dramatically on long paths, even if there is an alternate UHF backbone
available.

This would be the ideal situation. We could pipeline bulk data through
the UHF backbone, and use the 6m MS path for priority delivery packets
for those times when interactivity is important (though waiting for
enough meteors would make latency intolerable for larger amounts of
data). Smarter router software than we are using now would be needed,
IE it would have to try to honor the priority flag in the TCP/IP header.
This would be a good way to implement an asymmetrical channel for websurfing.
Mouse clicks could go via the low latency channel, and bulk page downloads
by the UHF pipeline. This is approximately how asymmetric satellite web
access operates, IE the down channel is a high speed satellite link
while the up channel is via an ordinary telco dialup modem.

Note, the same idea of asymmetric channels can be applied using HF
skywave too. All we need to make that happen today is smarter router
software (and smarter application software that knows when to request
a higher priority, and equally importantly, when *not* to do so).

> Full Duplex, with FEC , and .5GFSK would work for meteor scatter. But,

>meteor scatter. One that would allow "fills", without complete multiframe
>packet retransmission. DSSS would make simplex meteor scatter a worthwhile
>thing to pursue. Simplex technigues should also have FEC.

I agree. The big bugaboo for full duplex is the duplexers. They are
both large and expensive for 6m. This is especially true since MS
is relatively weak signal, so not a lot of insertion loss on receive
can be tolerated. And the bandplans don't make enough splits available
anyway.

DSSS is a much better approach. We can stack a lot of stations in
the available spectrum using the inherent code division multiplexing of
DSSS. I'm also in complete agreement that a better (or at least different)
link level protocol is needed. The problem now is to come up with a good
6m SS rig capable of exploiting MS which is also cheaper than a set of
6m duplexers and associated ordinary 6m rigs. I think that's possible.

6647. GPS and Packet Q's

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-19 00:00:00 UTC
From: hartzeld@cc.sdstate.edu
Message-ID: <59bu06$den@ganesh.sdstate.edu>
Source record: 32850

Just curious about these two and how hams are using them. I understand the principle, but I was wondering how an interface between the GPS receiver and the packet modem would work.

Do the GPS receivers have an RS-232 output on them or something? Which ones? What software would I need to run in order for this to work?

I see that the latest version of the Kamtronics KAM has support for a GPS reciever. What does this mean?

Thanks-Dave N0TGD

>Of course there are other ways to demodulate AFSK. One popular way
>is to use a PLL that tracks the input frequency, and use the control
>voltage of the VCO as "demodulated data" signal.
>This method is used in many integrated FSK demodulators.

Yeah. A PLL demodulator is mathematically equivalent to a filter
demod for coherent signals. It is essentially a filter demodulator
with a tracking filter. In other words, the slewing filter formed
by the PLL simulates the combined responses of the dual matched
filters of the filter demod. Getting equivalent matched response
requires some subtle tuning of PLL parameters though, and performance
is poorer on non-coherent FSK signals because loop lock has to be
regained stepwise. That either serves to limit speed, or opens
the loop momentarily to excess noise response during relock, IE
during bit transitions.

In the degenerate case, a PLL is a Q multiplier, using feedback
to achieve very high gain and a very narrow frequency response.
What separates the PLL from the Q multiplier is that it also
tracks the signal being enhanced in frequency, IE it has a
swept response dominated by loop gain and the loop filter
response. The error loop voltage then becomes recovered FSK
modulation. The strengths of the PLL are also its weaknesses.
Because it uses feedback, it is prone to instability, and because
it has high gain, it is more susceptable to noise. That makes
designing a *good* PLL demod more challenging than designing
an equivalent performance filter demod.

In hardware, the parts count for a PLL demod is lower, but component
values are more critical, and in software the number of T cycles needed
is fewer, but the coefficients are much more critical, if you want
equivalent performance. You can be sloppy with a filter demod and
still have something that works. If you get sloppy in the wrong
ways with a PLL demod, all you'll have is a noisy oscillator. You
can make a filter demod unconditionally stable, but a PLL can only
have conditional stability. (If it were unconditionally stable,
it would degenerate into just a gain limited Q multiplier.)

The PLL demod is easy to do, but the matched filter demod is easier
to do *well*, and is more general in that it works equally well
on non-coherent FSK as on coherent FSK. Each parameter is *separately*
tunable, whereas in the PLL case all the parameters interact very
strongly. The PLL is a more elegant solution, but its apparent

simplicity masks some subtle complexities of implementation. The
filter demod is a more brute force approach to the same result.
It trades less elegance of approach for a more straight forward
implementation.

Dave:

The interface can work several ways - some TNCs support the GPS output format NMEA (I think I'm remembering that write) - but most GPS receivers will output RS232 if they have output capabilities. The difficulty is that usually the GPS output is the only output you can send to the TNC (it's in GPS mode and is waiting for the GPS receiver to output solutions to it), the TNCs that are advertised to support GPS usually have a second port for the GPS, keeping the original port available for "regular" packet.

This setup is commonly implemented in the high altitude balloon groups - which is were I've had my experience with it - if you're email is South Dakota State Univ. there is a balloon group associated with the space grant consortium at the university - and I think it's tapped into some of the local hams - you might also want to check with them.

Hope this is helpful

>an HP48 as the terminal. Does anyone have any experience with this?
>--

I have used the HP48 on packet. The display is small, 30 characters per line, and only a few lines.

The software I tried truncated any line longer than the display width. I solved this by setting the tnc line length to 30 characters. Still, because of the small display, data flies by faster than can be read and there is no way to scroll back to read it.

So, if you like those limitations, it works. If you find software that allows scrolling, I would like to try it.

73,
John K7SII

6657. Emergency communication with packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-19 00:00:00 UTC
From: tgeyer@rain.org
Message-ID: <59citd$n6l$1@news.rain.org>
Source record: 32910

As a relatively new ham, I'm getting interested in packet. I would like to be able to use my packet station in case of a local emergency (fire, earthquake; both quite common here in Santa Barbara) when there is no power.

I'm looking for a TNC that works without wall power. I understand there are some micro-sized devices and even the Kam KP-3 (?) can run on a nine volt battery. I already have a laptop computer.

My question concerns the packet BBS. As I understand it, when I connect to a PBBS, I am connected to somebody's PC. Then my message is forwarded along (not sure how). If I want to get messages out during an emergency, am I reliant upon the PBBS having emergency backup power? Thus, if the local guy running the PBBS has his computer plugged into the wall with no backup, am I looking at a single point failure?

I assume the PBBS must be exchanging data with a digipeater somewhere. Would I be able to talk directly with the digipeater using my TNC?

Please help a newbie get informed.
Tom

I have a TAPR/AMSAT DSP-93 modem kit that has been professionally assembled. I purchased it this summer from a fellow club member who was overwhelmed with it. It has been assembled and verifed by me on the test bench. I have all paperwork, manuals, box, cables that come with the kit. Since I already have 2 AEA DSP2232s I do not need another TNC. I did really enjoy building the kit however! If you are interested make a resonable offer, or trade, and it's yours. I do not have a fixed price in mind, but I do know what I did pay for the unit. Tnx for your time.

>Windows 95. Everything seems to work fine except the MHEARD function.
>Information displayed in this function is in some strange machine type
>characters. Any Ideas? Thanks, Gary
>

I've had a number of strange things like this. Confused, I called AEA and
asked tech support about them. Most often, the problem winds up that,
somehow, the paths that are stored for the pointers to lots of the needed
files are, somehow, wrong.

Turns out that one can't just move things about with PPWIN and go coyly
along the way. When PPWIN is installed it interlocks several directories
and paths in more places than you might think. For example, it modifies
the *.INI files as well as its own PPWIN.INI file. If all the pieces of the
puzzle don't fall into place after the install, pointers to files on the disk
can then point to absolute garbage, it seems.

I can only guess that the problem may be like the horrible fright Prodigy
caused by initializing STAGE.DAT to be so many megabytes, on the disk
at install time, but then, not formatting the disk space to null or something
that overwrote the old data on those sectors! When a curious fellow looked
at the STAGE.DAT file - horrors, there's all my old love letters in there!

AEA tech support confirmed that if these kind of problems exist, most of the
time it is due to a faulty install. More specifically, it is impossible to just,
ahem, zip up the PPWIN directory and "move" it to some other machine!
Ergo, one cannot just pirate off PPWIN, one *MUST* install it cold turkey
and set the serial number and all up every time any major machine change
is made.

The problem can blind side you in some other less obvious ways. Say you
need more disk space on "C" where it is installed. Viola! You XCOPY it
all over to drive "D" where, that old high school scholastic league drama
short play suddenly appears!

"Sorry, wrong number!"

Wipe it completely off the disk. Take the original source disks, which,
hopefully you learned a *long* time ago that you should *never* use
for a real installation. Take the *fresh* DISKCOPY set off those and
then do a completely clean install to your target machine. PPWIN is
a smart intaller; it remembers who you are, your disk stuff etc. At least
AEA didn't copy proof the original disks like some (&*^&*^%$ sources
and you can legitamately protect your investment, as I see it.

If you set up the whole system correctly and get all the holes properly filled in the install routine for the ID stuff and your modem type and hardware is set right during the install, your problem will likely go away.

Of note, there are several offical versions for PPWIN running around. I was told at HAMCOMM in Dallas by AEA when WIN-95 first came out, that only the latest version of it would not give trouble with WIN-95. Because I needed it to run under OS/2 in a WIN/DOS VDM session, I asked him if they had solved the polling insantity that tore up OS/2's pre-emptive multi-tasking so badly by bashing the CPU to death in that version. I was told, we made some improvements on that, yes. Therefore, I bought it.

I'll pass along my experience to you, in that this is in the OS/2 base. The latest version DOES work well under OS/2 in the WIN 3.1 mode (Enhanced, I think needed!) However, to wrestle this alligator gar to the bottom of the tank and survive, you need both Ray Gwinn's SIO as well as a utility called TAME 3.2 or later which floats around written by David G. Thomas, last of 4290 Bells Ferry Road, Suite 106 Room 567, Kennesaw, GA 30144-1300.

I have found that virtually all of these TNC programs not written specifially for OS/2 that are DOS varmints still are murder on the CPU without this utility. There are others that work somewhat, but the best tool for forcing a comm program to get along with OS/2 is this little cheap utility.

All you have to do to see it work is to run PULSE in WARP 3.0 forward. Add tame, and presto, the better TNC stuff like PPWIN. PACKET 6.0, AEA's PACKRATT programs and others suddenly stop fighting you and go to work.

I've avoided WIN-95 like the PLAGUE, but I'll bet TAME can help solve problems in it as well for comm programs that are not specific to it.

See! Now you know how to build an alarm clock here as well...

:)

>and computer. Thanks David VA3MRJ
>
>

If you're running windows, don't expect a baycom modem to run properly.
So far I've not heard of anyone successfully getting baycom modems to
function properly if Windows 3.1, win95, os/2, Linux, or WINDOWS NT is
running as the software for the baycom requires the computer to constantly
monitor a port for changes, and then translate it. Be grateful you have
the PK232, but if you're determined to have something to carry around, the
TINY 2 from PACCOM, or the KPC-3 from kantronics are much better choices,
and don't produce errors like trying to use a baycom modem with an
operating system or two that demand most of the computer's attention. In
other words, unless you find a program written to work under windows using
the baycom software, good luck. I also remember one chap claiming that he
had JNOS, the tcp/ip software running a baycom modem under win95, but he
never explained how he got it to work, and I can't for the life of me
remember his call.

>volt battery. I already have a laptop computer.

AFAIK, all TNCs on the amateur market can run off 12 VDC. So you can
use the same power source that your radio uses, IE car battery, gell
cell, etc. PacComm appears to offer the TNCs with the lowest current
consumption, IE their Micropower line. The KPC-3 has a low draw too.

>My question concerns the packet BBS. As I understand it, when I connect
>to a PBBS, I am connected to somebody's PC. Then my message is forwarded
>along (not sure how). If I want to get messages out during an emergency,
>am I reliant upon the PBBS having emergency backup power? Thus, if the
>local guy running the PBBS has his computer plugged into the wall with no
>backup, am I looking at a single point failure?

Yep. If you depend on a single PBBS for all your traffic forwarding,
when it fails, you're hosed. It is the same as if you depended on
a single ISP for your internet access. If it is down, you're out of
business. The obvious solution to this is to not become dependent
on such a single point.

>I assume the PBBS must be exchanging data with a digipeater somewhere.
>Would I be able to talk directly with the digipeater using my TNC?

A digipeater doesn't store and forward messages. It only stores
and forwards (immediately) individual packet frames. You can think
of it as somewhat akin to a voice repeater, except half-duplex,
in this regard. It is a range extender, nothing more. (Digipeaters
are really an obsolete concept, though there are still a lot of them
around. The modern approach is to use a packet switch, called a
router or node, instead.)

If your PBBS normally forwards message traffic out of the local
area, it does so to another PBBS. It may reach this other PBBS
via digipeaters, switches, nodes, etc depending on the particular
network topology in your area. And it may do so on the same frequency,
or on a different frequency called a "backbone channel". The latter
is the preferred approach since it separates user traffic from bulk
PBBS forwarding activity. Nodes and switches may also relay onto a

backbone channel rather than directly back out onto the local user channel. This improves network efficiency.

There are a number of ways to avoid having single point failures in the network. The most obvious is to have redundant backup routes for traffic. If one PBBS is down, have an alternate you can use, if one switch or node is down, have an alternate you can use, etc. You should get in touch with whoever manages the network topology in your area and find out about these alternatives. If there are bottlenecks, volunteer to supply alternatives yourself if no one else will.

All hub and spoke networks are subject to single point failures. In essence, the PBBS system is a hub and spoke network for message traffic, with the PBBS being the hub. Often the better course is a peer to peer network where stations can forward traffic directly to its end user destination. This is the model of the TCP/IP network. If there is sufficient crosslink connectivity, and the routers are smart, this sort of network can tolerate multiple failures and continue to operate.

Dear friends,

My AEA DSP 2232 doesn't work right.
I'm getting on the little screen of the TNC the following,
Packet
Packet
and both lights DCD and CMD are on.

On the screen of the computer appears the following message when I
communicate with the TNC,

cmd: 3d: DSP software load failed and sometimes
cmd: 2e: DSP software load failed.

I dont know if the Microchip Motorola 56001zl20 is doing wrong or some
statics on it or other.
I can communicate and change modems, etc without any problem.
How can I solve this problem..
AEA they say is in process of closing, so they can not help me.
Please some one do it. If you have service maunal check the error
messages and answer me.
Awaiting your kind comments, have my best.

Here is what I did. Go to RS and get the following

279-440 Quick Connect 8-pin modular plug $6.39 (Ouch)
xxx-xxx 2-conductor plug for speaker in the back 2/$0.99 (i think)

Get a 4-conductor shielded cable and cut back about 2" of insulation.
Connect the PTT and mike audio to the appropriate pins.
Fold back the speaker and gnd so they exit where the cable enters.
Put the RJ-45 together as shown on the package.
Cut two wires at least 10" and solder to the speaker and gnd wires.
Attach the speaker plug to the two wires (dont forget the plastic
shield prior to soldering the wire)
Connect the appriopriate connector for you TNC.

Have fun.

>stifles the development of packet.

The FCC did change that rule. Now only the originating station
and the *first* forwarding station are liable for the content
of a message. *And* the rule says that if the first forwarding
station uses a method of authentication for the originator, the
burden for content is lifted from the first forwarding station.
Thus we seem to have the rule in place that we need.

6675. RAPID CASH

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-21 00:00:00 UTC
From: Free Money <money@money.com>
Message-ID: <32BBAF07.679C@money.com>
Source record: 32928

This is the fairest, most honest way I have seen to share in the wealth of the world.!

Take five minutes to read this and it WILL change your life. If you want to know how to make thousands of dollars quickly, legally, and with NO CATCH, then keep reading.

The Internet has grown tremendously. It doubles in size every 4 months. Think about it. You see those 'Make Money Fast' posts more and more. That's ... because it WORKS ! So I thought, all those new users might make it work. And I decided to try it out, a few months ago. Besides, what's $5.00, I spend more than that in the morning on my way to work on coffee and cigs for the day. So I sent in my money and posted. Everyone was calling it a scam, but there are SO many new users from AOL, Netcom, etc. they will join in and make it work for you.

Well, two weeks later, I began receiving bucks in the mail! I couldn't believe it! Not just a little, I mean big bucks! At first only a few hundred dollars, then a week later, a couple of thousand, then BOOM. By the end of the fourth week, I had received nearly $47,000.00. It came from all over the world. And every bit of it perfectly legal and on the up and up. I've been able to pay off all my bills and still had enough left over for a nice vacation for me and my family.

Not only does it work for me, it works for other folks as well. Markus Valppu says he made $57,883 in four weeks. Dave Manning claims he made $53,664 in the same amount of time. Dan Shepstone says it was only $17,000 for him. Do I know these folks? No, but when I read how they say they did it, it made sense to me. Enough sense that I'm taking a similar chance with $5 of my own bucks. Not a big chance, I admit--but one with incredible potential, because $5 is all anyone ever invests in this system. Period. That's all Markus, Dave, or Dan invested, yet their $5 netted them tens of thousands of dollars each, in a safe, legal, completely legitimate way. Here's how it works in 3 easy steps:

STEP 1.
Invest your $5 by writing your name and address on five separate pieces of paper along with the words: "PLEASE ADD ME TO YOUR MAILING LIST." (In this way, you're not just sending a dollar to someone; you're paying for a legitimate service.) Fold a $1 bill inside each paper, and mail them by standard U. S. Mail to the following five addresses:

1. Michael Barratt - 27 Park Ave. - Poughkeepsie, NY 12603

2. Brian Truter - 101 N. Park Avenue - Springfield, IL 62702

3. J. Campbell - 1040 C Winners Circle - Bowling Green, KY 42104

4. Joost Walter - P.O. Box 259 - 2870-AG Schoonhoven The Netherlands

5. S. Thomas - P.O. Box 4945 - Tampa, FL 33677-4945

STEP 2.
Now remove the top name from the list, and move the other names up. This way, #5 becomes #4 and so on. Put your name in as the fifth one on the list.

STEP 3.
Post the article to at least 250 newsgroups. There are at least 19000 newsgroups at any given moment in time. Try posting to as many newsgroups as you can. Remember the more groups you post to, the more people will see your article and send you cash!

STEP 4.
You are now in business for yourself, and should start seeing returns within 7 to 14 days! Remember, the Internet is new and huge. There is no way you can lose.

Now here is how and why this system works:

Out of every block of 250 posts I made, I got back 5 responses. Yes, that's right, only 5. You make $5.00 in cash, not checks or money orders, but real cash with your name at #5.

Each additional person who sent you $1.00 now also makes 250 additional postings with your name at #4, 1000 postings. On average then, 50 people will send you $1.00 with your name at #4,....$50.00 in your pocket!

Now these 50 new people will make 250 postings each with your name at #3 or 10,000 postings. Average return, 500 people= $500.

They make 250 postings each with your name at #2= 100,000 postings=5000 returns at $1.00 each=$5,000.00 in cash!

Finally, 5,000 people make 250 postings each with your name at #1 and you get a return of $60,000 before your name drops off the list. And that's only if everyone down the line makes only 250 postings each! Your total income for this one cycle is $55,000.

>From time to time when you see your name is no longer on the list, you take the latest posting you can find and start all over again.

The end result depends on you. You must follow through and repost this article everywhere you can think of. The more postings you make, the more cash ends up in your mailbox. It's too easy and too cheap to pass up!!!

So that's it. Pretty simple sounding stuff, huh? But believe me, it works. There are millions of people surfing the net every day, all day, all over the world. And 100,000 new people get on the net every day. You know that, you've seen the stories in the paper. So, my friend, read and follow the simple instructions and play fair. That's the key, and that's all there is to it. Print this out right now so you can refer back to

this article easily. Try to keep an eye on all the postings you made to make sure everyone is playing fairly. You know where your name should be.

If you're really not sure or still think this can't be for real, then don't do it. But please print this article and pass it along to someone you know who really needs the bucks, and see what happens.

REMEMBER....HONESTY IS THE BEST POLICY. YOU DON'T NEED TO CHEAT THE BASIC IDEA TO MAKE THE BUCKS! GOOD LUCK TO ALL, AND PLEASE PLAY FAIR AND YOU WILL WIN AND MAKE SOME REAL INSTANT FREE CASH!

*** By the way, if you try to deceive people by posting the messages with your name in the list and not sending the bucks to the people already included, you will not get much. I know someone who did this and only got about $150 (and that's after two months). Then he sent the 5 bills, people added him to their lists, and in 4-5 weeks he had over $10,000!

Amateur Advanced Classes -Lindenhurst

Great South Bay Amateur Radio Club Amateur Radio Classes

ADVANCED THEORY CLASSES -

The Great South Bay ARC has scheduled Advanced classes beginning
on Wednesday January 8, 1997. Classes start at 7:30 PM and
will continue to 9:30 PM.

The class instructor is Phil Lewis N2MUN.

Classes are FREE. All students are required to have the ARRL
Advanced Class Study manual (4th edition good through June 30, 1999).
Available from the ARRL, 225 Main St., Newington CT 06111.

ADDITIONAL INFORMATION

All classes are located in the basement of Babylon Town Hall,
200 E. Sunrise HWY, Lindenhurst NY in the Emergency Operations Center
(ARES/RACES Room), access is gained via the door at the bottom of the
stairs at the rear of Town Hall.

If you are interested in attending a class or you know someone who is,
have them contact Walter Wenzel KA2RGI (516) 957-0218 for additional
information or just come on down to class.

Information is also available during the GSBARC 2 meter info net every
Monday evening at 7:00 pm on the WB2FKZ repeater, 146.685 -600 4Z(136.5)
PL required. You may also write to:

GSBARC
P.O. Box 1356
West Babylon, NY 11704

Visit GSBARC online at http://www.li.net/~tomcar/gsbarc.htm

VE -Lindenhurst,LI Dec 22

The Great South Bay ARC hosts ARRL amateur radio exams every 4th
Sunday at 12 noon. Please note the change for the month of June.
Re-scheduled because of Field Day and Father's Day.

Exams are given from Novice to Extra class.
All exams are ARRL/VEC, CW exams are multiple choice w/ full headphones.
The examination site is in the ARES/RACES room located in the basement.
Access is at the rear of the building via stairs. Ring RED (TOP) buzzer
for entry.

Location: Babylon Town Hall
Emergency Operations Center
200 E. Sunrise Hwy.
North Lindenhurst, NY

Talk in : 146.685/r 136.5pl

Please bring the following:
- Photocopy and original of current Amateur Radio License if licensed.
- Photocopy and original of CSCE(s) that are current.
- two forms of ID, at least one photo ID.
- pens or pencils.
- Calculator for math problems on exams, no pocket computers are allowed.
- 1996 Exam fee is $6.05, please bring exact change.
* Novice exams (elements 1A & 2) are free.
- **** 1997 Exam fee will be $6.25

For addition information you may contact:

Source record: 32933

I'm looking for the accessory connector, or a compatible plug to set
up packet with my AP50 handheld - but haven't had much luck over here
(even with my Motorola dealers) - it's 100% compatible with the Radius
GP300 series of handhelds from Motorola.

Anyone have any sources? Please email me. Thanks.

Yep there sure is..try Wal-Mart or just about any computer store
maybe even Radio Shack. There is a cable or if you prefer there
is an adapter that will take your existing dual 25 pin cable and
make one end a 9 pin female to fit the computers Serial port.

6684. AEA2232 help needed-SOS

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-21 00:00:00 UTC
From: pc_honde@jet.es
Message-ID: <59h4tiquj1@diana.ibernet.es>
Source record: 32937

Dear friends,

My AEA DSP 2232 doesn't work right.
I'm getting on the little screen of the TNC the following,
Packet
Packet
and both lights DCD and CMD are on.

On the screen of the computer appears the following message when I
communicate with the TNC,

cmd: 3d: DSP software load failed and sometimes
cmd: 2e: DSP software load failed.

I dont know if the Microchip Motorola 56001zl20 is doing wrong or some
statics on it or other.
I can communicate and change modems, etc without any problem.
How can I solve this problem..
AEA they say is in process of closing, so they can not help me.
Please some one do it. If you have service maunal check the error
messages and answer me.
Awaiting your kind comments, have my best.

I recall some time ago (when I was a 2232 owner) that someone
on the 2232 reflector had a problem where the DSP chip simply
became loose in the socket. It is certainly worth a try.

6686. 9600 TNC Advice

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-21 00:00:00 UTC
From: "Brian K. Short" <ke7gh@primenet.com>
Message-ID: <32BC269B.EE8@primenet.com>
Source record: 32939

Seeking advice on purchasing a (used) 9600 baud TNC like the PK-96 or KPC-9612 etc. I will use it for local TCPIP (perhaps), but primarily for 9600 baud satellite use. I previously owned a DSP-2232 and do own a G3RUH external modem (that works well), but would like something small and simple for dedicated 9600 packet use.

In answer to your questions, yes, you would be dependant on the bbs and/or digi having some sort of emergency power. If the bbs is located out of the immediate disaster area they probably will still have power. What you should do is look for digis or nodes that are always on, that you can access, and that are far enough away that they would not likely be affected by a local disaster. You might also ask the local bbs sysops if they have emergency backup or if they know which systems do. Another resource is your local ARES, RACES or Red Cross affiliated amatuer radion clubs, they should have a listing of stations that are available during emergencies. Be aware that you may not have access to these systems during emergencies unless you are actively involved with the emergency communications. This is a good time to volunteer your services to the above mentioned groups and participate regularly in scheduled drills and training sessions.

6688. Re: Help wiring up my Kantronics 9612. Kenwood TM733a for one radio operation

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-21 00:00:00 UTC
From: kn4aq.gary@mms.net
Message-ID: <59hca6$3m3@ralph.vnet.net>
Source record: 32941

I put a couple jumpers in my 9612 so I could connect just one cable from the 9612 to the data port of the 733, but switch between 9600 and 1200.

I use the 9600 DB15 connector. Normal connections are:

9612 pin 733 pin
1 PTT 3
2 9600 RX 4
3 9600 TX 1
11 GND 2

and I added one extra wire to the cable going to the 733, and used an unused pin on the DB 15:

15 1200 RX 5 (this sends 1200 RX audio out the 9600 port to the 733, but not until you add a jumper in the 9612, described next)

I jumpered inside the TNC, on the circuit board:

From the DB 9 to the DB 15
(1200 port) (9600 port)
9 1200 RX 15 (this puts the 1200 RX onto the unused pin)
3 PTT 1 (this lets the 1200 side key transmitter)
1 1200 TX 3 (this mixes 1200 tx audio with 9600 tx audio**)

** the jumper from DB 9 pin 1 to DB 15 pin 3 mixes the 1200 and 9600 tx audio, and sends it on down the cable to the data port pin 1 on the 733 (it get's both 1200 and 9600 data in on the same pin). But, I found that just connecting them together loaded down the audio circuit, and there was very little tx audio. A 4700 ohm resister between the pins instead of a jumper provided some islolation. I had to move the 1200 audio level jumper in the 9612 to the "high" position and crank the 1200 gain pot up all the way to get normal 1200 audio level, but it works.

I sent this scheme to Karl WK5M at Kantronics (I think he's left there now), and he sent me a reply, shows below. I have not yet incorporated his suggestions, but you might want to.

>Here's what I did... let's see if you forsee any problems.
>
>I jumpered the PTT lines between the 15 pin and 9 pin connectors (on the
>9612 circuit board). Since the 733 uses separate 1200 and 9600 receive
>lines, I jumpered from the 9 pin receive line to an unused pin on the 15
>pin connector, and used an extra wire in the cable down to the DIN plug at
>the radio.
>

Actually, you should connect BOTH the 1200 receive (DB-9) and 9600 receive (DB-15) to the 9600 baud receive pin of the TM-733. Set the CD command to software since it's unsquelched audio, and set the TM-733 for 9600 operation.

>The only problem was the 733's common transmit "audio" input pin for both
>1200 and 9600. I jumpered that between the 9 pin and 15 pin connectors as
>well, but the 9600 audio seemed to get loaded down. So I put a resistor in
>the jumper to isolate the 9600 circiut some, and raised the 1200 level (a
>lot, I had to change the jumper position).
>

You can connect both transmit signals together to the radio, and set the ONERADIO command ON so both sides don't try to transmit at once. You will have to use the high level drive.

>It all seems to work fine, and I can use just one cable. Of course, the
>unit becomes kind of "custom" and the jumpers will have to be pulled out if
>I want to use it "dual port" again.
>

Done as indicated, the only difference for dual port or single radio would be the cable to the radio(s).

In that case HOW Packet work?

The line out of the radio is connect by a cable to the line in of the
sound card .

Those the "Volume" of the line in of the sound card have some affect
on decode the digital signals?

And if the line out of the radio is the headphones line out and I use
it to connect to the line in of the sound card, the volume of the
radio have affect on decode digital signals?

Humm.... well, I have the filling that this is confusing, but in other
words I want to decode digital signals using the headphone line to
connect to my sound board, my doubt is ... those the volume of the

radio, wich affect the volume of the headphones (when connect), and the volume of line in of my sound card have some affect on decode the digital signals.

I just hope you and everybody understand.

Source record: 32944

Hi,

I purchased recently from Icom a GP-22 and after many hours to
programming a software
for read the protocol send by this unit, i had a question ?

Its this product have the possibility to upload into the GPS ?
waypoints, routes etc
I check the connector from the interface ex-1443 for connect by RS-232
and this connector is mono ???? pinout for TX only???? or if a press the
button Prog on the GPS the output the interface ex-1443 pass to RX mode
???? Normaly with rs-232 pin 2, pin 3 and ground is necessary. If is the
case what is the sentence i do send to GPS for uploading a waypoint and
what is the form for transfert the data.

If you use a commercial software to do this, please lets me the name of
this product.

I send a e-mail to Icom sales and nobody can help me. I contact my
supplyer, but after
1 month and half and nothing, i think "seller" is very happy to sells
this product for release own inventory.....

Thank and Merry Christmas

Hi all,

sorry for answering that late, but our network was temporally disconnected from
the rest of the world, so I could't reply to the old thread (well, this an experimental
network, so what?).
However, I looked up what happened to the thread in a news archive.
Obviously there's more interest in that program than I expected, and yes, I am
continuing development. I will announce a beta version as soon as available in this
newsgroup.

Some words about the interface to the OS/2 inet.sys driver:
My program uses the same interface as the slip.exe driver supplied with OS/2 Warp 3
does. This interface is - to my knowledge - not documented and not supported by
IBM, I had to correspond with one of the developers of the TCP/IP Network system to
get the information required. Writing a NDIS driver is possible, but in my opinion by
far to complex for this purpose.

Message-ID: <59glt1$vun@dg1kjd-svr.ampr.org>
Source record: 32947

Hello Glenn and friends (and all other HAMs, too of course),

By now I heard from different sources that slowing down ethernet cards for 10 GHz high speed links to about 2MBit/sec is not possible. Why? I currently have the problem of interfacing my 10 GHz project with my linux host.
An old 10 MBit/sec ethernet would be ideal because you have an AUI port with differential signals for RX and TX, it is simple to use because there are standart drivers and last but not least it's a very cheap way. Why can't I slow it down by simply replacing the 10 MHz crystal oszillator on it with a 2 MHz version?

6699. Blocking ham/cb radio interference on stereo equipment?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-22 00:00:00 UTC
From: Kingfish@voicenet.com
Message-ID: <59jre1$5bp@news1.voicenet.com>
Source record: 32857

Hi Everyone,

A neighbor of mine has a ham or cb radio, and his transmissions come out over my stereo, telephone, clock radio - anything with a speaker. The FCC won't do anything about it.

I know there are filters you can put on your telephone to block some of the interference. Is there anything like that for stereo equipment?

Thanks,

JOn

Actually, I think Nov 15th is the day they closed the doors. The
original owner came in to try and save the place, as it got run in to
the ground, but by the time he came in, It was too late. I have heard
they went chapter 13, but that part I can't verify.

Later,
DAve

6703. soundcard radio modem for us

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-22 00:00:00 UTC
From: poseidon@ziplink.net
Message-ID: <32bdb629.95945273@news.ziplink.net>
Source record: 32861

Hi all,
not long ago messages started to appear on different newsgroups about soundcard/modem being developed for radioamatuer use. I know that Thomas Sailer has started to offer software suitable to transmit faxes over radio with the help of a sound card. There is another project though, to convert a SB soundcard into a 9600 modem. Sounds revolutionary given the fact that PI Card costs $120 and a sound card about $29-39 and is ready for use.
How do you, folks, percept the whole project? Do you know anything more about it. How is it going to affect out community?

thanks for any input.

Benedict

>Can you send me any info?
>Thanks in advance.
>Julio, EB4CUV.

At least for Yaesu, they are transceiver-type specific. You will
usually find them in the user manual, sometimes only in the service
manual.

I think Icom has a more structured approach, but it is just as hard
to get any info. There usually is no specification in the user manual.

Kenwood, well, don't mention it. For some transceivers, for which
remote control is available, they simply won't publish the information.
It is apparently only to be used by their own remote control boxes.

>=20
> >A few questions concerning PCS antennas:
>=20
> >1. I've noticed that many PCS antennas are equipped with DIN 7/16 =
rather
> > than N connectors. Why?
>=20
Tradition is the main reason. The US has used the 7/8 EIA connector for =
many years . It is a low loss, very low VSWR, high power universally =
used connector well suited for this application. It is well defined in =
an EIA specification. Because of the large volume in use, it costs =
considerably less than a 7/6 DIN.

However, the first PCS systems were built in the UK and they are not =
familiar with EIA specifications. The DIN is a German specification and =
most if not all DIN specs are translated and Used in the UK with a UK =
equivalent.

When it came time for the US PCS system, many of the engineers and =
consultants were employed by the US companies and they used what was =
familiar to them.

Then the herd instinct took hold and everyone used the 7/16 DIN.

In any category, the 7/16 DIN and the 7/8 EIA are equal in performance =
and the 7/8 EIA has the advantages of lower cost and also being a =
hermaphrodite
connector (that is sexless). Mating connectors are identical with a =
"bullet" center conductor connector. The 7/8 EIA can also be =
pressurized.

> >2. I've also noticed that many PCS antenna specifications now include =
an
> > intermod spec. Is this spec as measured off the assembly line or

exhibit
> > good intermod specs when it's brand new and that performance after =

> > exposure to weather is the distinguishing factor. Or have I =
missed=20
> > something?)
>=20

No, you haven't missed anything. It's a good point. The intermod is =
measured at the end of the assembly line. It is incumbent on the design =

to insure it doesn't deteriorate and the buyer to discern that this is =
true.

> >3. What is the preferred method for measuring PCS antenna intermod
> > characteristics?
>=20

The exact components are usually shrouded in secrecy. There is not =
accepted specification. =20

The concept is old. The 2a-b mix (third order) is usually the problem, =
being the strongest, So you generate 2 stable power sources (usually 20 =
watts or greater and apply them to the device under test. Then with =
great selectivity, reject the 2 signals and measure the resultant third =
order.

> >Any thoughts or insights would be appreciated.
>=20
>
The intermodulation specification has deteriorated into a numbers game =
similar to gain with every vendor making higher claims.

The intermod specification required by the PCS system is also a nebulous =
number constantly escalating well into the realm of imagination.

Does this answer your questions/

6711. Using the MFJ-1276 TNC on Pactor

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-22 00:00:00 UTC
From: Rich Abbot <abbot@superlink.net>
Message-ID: <32BD5029.4AF5FE51@superlink.net>
Source record: 32952

Hi Folks,

Does anyone have an MFJ-1276 TNC, and use it for Pactor operation?

If so, allow me to describe to you what my unit is doing.

The TNC starts normally, in packet mode. I then put it into
Pactor mode:

cmd: pactor

I see the Pactor sign-on banner:

[MFJ PACTOR $07 - 10128 free]

Then, say, I want to send a CQ in FEC/Unproto mode. So I type:

p_cmd: u1

and indeed my transmitter keys up. But the strange thing is,
if I don't touch my keyboard for about a second, the FEC mode
is stopped and I suddenly see the Pactor sign-on banner again.
No hands required!

According to the 1276 manual, the FEC mode should persist until
I decide to terminate it by typing a control-c followed by 'D'.
That's not happening for me. Also, if I try to connect to
another station, a similar sequence of events happens:

p_cmd: c w2abc
***Connecting to w2abc
p_cmd:
[MFJ PACTOR $07 - 10128 free]
p_cmd:

After each of these transactions, the unit behaves as if I just
entered Pactor mode from packet mode. Weird, no?

Pactor decoding seems to be working well - I have no trouble
tuning in Pactor QSOs, but I'd sure like to join in!

I've used the TNC for a year on 2m packet, so my problem is
related specifically to its Pactor side. So, 1276 owners, I'd
appreciate your input on:

- Your unit does not behave this way, right?

- To get your unit to work on Pactor, did you have to change
any of the internal jumpers, or do anything else special?

- What are the correct settings for baud switches 6, 7, and 8 for VHF packet and HF Pactor operation? The manual describes only switches 1-5 in any detail.

I really appreciate any advice...I called MFJ on this and didn't get much useful information.

Thanks and 73,

Rich, WB2MBM

6712. Icom switching problem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-23 00:00:00 UTC

Message-ID: <01bbf064$526d20e0$36229bcf@kn6dv.qnet.com>
Source record: 32866

I have a Icom 775DSP and a Icom 706.
Both have the acc. Plug # 1 and 2.
I am using pin # 3 of the acc #2 to switch my amplifier (with the Ameritron ARB-700 relay buffer)
using pin # 3 of acc plug1 to switch the radio TX on and off from the computer via a level converter.
I am using this future for RTTY (I am using RITTY by K6STI)

Here is the problem I am having.
As soon I connect acc plug #1 (the one from the computer level converter) the amplifier switch on, it does this even with the level converter disconnected from the computer.

I also have tried a different relay buffer for the amplifier but the same thing happens again.
So far I have tried anything I could think of an no result (It drives me nuts) I even build a second level converter.

Any help would be appreciated.
Thanks 73 Will, KN6DV

> function properly if Windows 3.1, win95, os/2, Linux, or WINDOWS NT is
You probably should check newer Linux Kernel Sources (2.0.4 or later),
there's a driver for the baycom 1200 baud modem.

> running as the software for the baycom requires the computer to constantly
> monitor a port for changes, and then translate it. Be grateful you have
So what? If it can do this directly (i.e. not through a virtualized COM
port, as in a windoze dos box), then what's the problem?

> the PK232, but if you're determined to have something to carry around, the
Eek. How are you going to implement more sophisticated channel access
protocols, such as Optima or DAMA? No chance with a 232. And it has
a lousy DCD circuitry.

> TINY 2 from PACCOM, or the KPC-3 from kantronics are much better choices,
If you're _really_ looking for something small, use your laptops sound
device.

I own one of these, and as far as I know there is no way to send data
to the unit. You can only receive data *from* the unit. This is one
of several limitations of the GP-22 that drove me to buy a Garmin 45.
The GP-22 has very limited capabilities compared to more modern (and
cheaper) alternatives.

>
>I think Icom has a more structured approach, but it is just as hard
>to get any info. There usually is no specification in the user manual.

The IC-706 manual has the full Icom C-IV control set in chart form,
and includes data frame structure and timing information as well.
That's all there is to know about their control scheme. Not all
Icom radios implement the entire control word set, and the IC-735
uses a slightly different structure. The info needed to make them
all interoperate is in the IC-706 manual, however. Icom will also
sell you a separate document about the C-IV bus, but it doesn't tell
you any more about programming than what's in the IC-706 user's manual.

It should be pointed out that the Icom C-IV system is not compatible
physically or programatically with the Yaesu CAT scheme, and neither
is compatible with the various schemes Kenwood has used for their radios.
If you want to control several Icom radios, their bus design is best
because it is an addressable serial bus which can be daisy chained, IE
conceptually it is a bit like ethernet. But the Yaesu CAT scheme is
simpler to interface to your computer if you only have one radio to
control.

Sounds like you have a ground loop problem between the rig, amp, and
computer. Carefully trace out all possible return paths and see if you
can spot it. You may have to isolate one or more of the control paths
with optoisolators if you can't fix the ground loop problems. (I'd
bet on the computer being the source of the ground loop.)

Hello One and all,
I am looking for a PC based programme that will allow me to decode
packet radio using my soundblaster board. If anyone can point me in the
right direction it would be much appreciated.

From: Elis & Dalvin <publinet@indi.it>
Message-ID: <32BEB964.27D6@indi.it>
Source record: 32874

Thanks for reading this message.
Im am looking for info how to modify Kenwood TH77E for 9600 bd
packet radio operations.
I found a www page, but unfortunately it is on german language !
Many thanks for reply.
Merry xmas.

I would not buy a PK-96. Don't know the KPC-9612.
Find something that has a real G3RUH or DF9IC modem, not a K9NG modem.

The feature you are looking for is an EPROM used to synthesize
the transmit waveform, and 4 jumpers or switches to select a waveform
that works best with your transceiver.

Jens David DG1KJD (dg1kjd@dg1kjd-svr.ampr.org) wrote:
: Hello Glenn and friends (and all other HAMs, too of course),

: By now I heard from different sources that slowing down ethernet cards for 10 GHz
: high speed links to about 2MBit/sec is not possible. Why? I currently have the problem
: of interfacing my 10 GHz project with my linux host.
: An old 10 MBit/sec ethernet would be ideal because you have an AUI port with
: differential signals for RX and TX, it is simple to use because there are standart
drivers
: and last but not least it's a very cheap way. Why can't I slow it down by simply
: replacing the 10 MHz crystal oszillator on it with a 2 MHz version?

Jens,
Please see my thoughts about this on

```
|--------------- N6GN's Higher Speed Packet WWW Page -------------------|
| |
| http://www.tapr.org/~n6gn/index.html |
| |
|-----------------------------------------------------------------------|
```

The theory that it isn't possible came from one/some of the designers
of an Ethernet chip set by way of N6RCE who was orignially going to use
Ethernat cards with my RF hardware. As I mention on the above pages, I
still do not understand why it isn't possible. I can see nothing in the
silicon which is even capable of knowing that it's running at, say 15
MHz instead of 20 MHz.

So far, to my knowledge, no one has performed the simple experiment of
taking a pair of cards and replaced the clock with a signal generator
and decreased the frequency to see where things fail.

If you try this, please share the results.

I think you are referring to CI-V. Icom also did CI-IV but it is used
in an older generation of transceivers.

I have an IC-R7100 and the only page about CI-V in the user manual
describes how to set the baudrate and the device address, not the
actual protocol or command information.

I have a copy of a manual that is shipped with the Icom CI-V interface
and it has more detail about the protocol and some example programs,
but no detail about the IC-R7100.
So, when I would want to do some programming for my receiver I probably
will need another document, maybe the service manual.

>It should be pointed out that the Icom C-IV system is not compatible
>physically or programatically with the Yaesu CAT scheme, and neither
>is compatible with the various schemes Kenwood has used for their radios.
>If you want to control several Icom radios, their bus design is best
>because it is an addressable serial bus which can be daisy chained, IE
>conceptually it is a bit like ethernet. But the Yaesu CAT scheme is
>simpler to interface to your computer if you only have one radio to
>control.

It depends on what you want to do and which transceiver you have, but
Yeasu CAT never is simpeler, IMHO.

Both schemes basically use TTL-level async serial I/O, and to interface
them to the typical PC you need a MAX232 or equivalent level converter.
In the Icom radios the receive and transmit share a single wire, on
the Yeasu CAT they use separate wires. Other than that, the serial
interfaces are identical.

But there often is a catch with CAT: e.g. on the FRG-9600, there is no serial data from the receiver to the computer, and info like the S-meter reading is presented in analog form. To read it, you need an A/D converter input in your computer (apparently, the de-facto standard computer in Japan has this in its basic configuration). On the Icom line the s-meter data at least is presented in serial form.

I have also done CAT control of the Yeasu FT-212 and FT-712, and these transceivers have only single-direction control (i.e. there is no report-back of any status information from transceiver to computer). Also, many functions of the transceiver are not at all controllable via CAT, including basic things like selecting a memory channel or programming a memory.

CAT is a half-done job, just barely enough to be able to mention it as a feature in the ad. Sort of like "9600 baud ready".
When you really want to use it, you run into nasty limitations.
The timing is also awkward. You cannot generate the datastream using a UART and interrupt-driven output, you will need software delays to provide the inter-byte delay. Messy.

And while at first glance there appears to be a "5 bytes at 4800 baud" standard command format with CAT, the structure of the commands differs between implementations (e.g. the command byte can be the first or the last byte). Of course this doesn't really matter because you can only have a single device per serial port anyway, but it could be convenient to have some standardization e.g. when you would want to implement some control feature "for Yeasu transceivers" in a satellite tracking program. And that could be the kind of thing the original poster wanted to do.
(bad news: this isn't possible with CAT, you need to know what type of transceiver you are controlling)

> power.

Hi Tom-

The problem you have is not technical, but organizational. Who are you going to TELL that you're either OK, or not OK?

Emergency management agencies use hams extensively for communications during an emergency. But one of their biggest fears is the ham who didn't get trained BEFORE the event suddenly coming on the air expecting to ask for a fire truck and get one. It ties up frequencies that are being used to order large-scale resources to help many people.

My suggestion is to get involved in California's Auxiliary Communications Service (ACS). The program is a model for the whole country, and I think you'll have fun to boot.

They'll put you to work in their packet section, and you'll be part of a service that gets whole cities help instead of just yourself.

Good luck!

Bob

6728. PK-900 Firmware

From: "Bob (Parker) Calkins" <wa7nuu@halcyon.com>
Message-ID: <32BF5DB8.535E@halcyon.com>
Source record: 32882

Hi-

I just got my PK-900, with V7.1 Firmware dated Sept. 95. It seems to work OK (some maildrop erratics) but the Gateway function is very different from what other PK-900's I've seen.

On the others, you connect first to the maildrop, and enter a "G" to go to the gateway prompt. On mine, the gateway must be a separate callsign. Any suggestions on how to make mine consistent with the others on the same frequency. We'll all involved in disaster management and consistency would increase operator reliability.

I've noticed one other station with V7.1 Firmware, but it had a Mar 96 date. Any chance there's really a difference?

BTW, I'm on mark frequency 3624 in Western Washington State if anyone wants to try and connect and see what's happening.

Thanks

(Great newsgroup BTW. I haven't seen one Code/No Code fight!)

Hi David:
I have a pentium 133 with Win 95 and a 386-25 with Win 3.11.
Neither will run the Baycom modem thru windows. You have to run it from dos. The problem with the pentium and Win 95 is that the pentium uses a 16550 uart chip for the comm ports. The Baycom won't work that fast according to the authors. You need an 8250 uart (read slower clock) in order to use it. The authors are aware of the problem and are working on it. Someone may develop a "driver" for it soon.

Try seating the DSP chip. Many times the DSP chip will loosen with the heating
and cooling of the DSP-2232. This type of fault shows up when the DSP chip is
not seated fully in the socket.

Hello friends
A few months ago I was intrested in using analog TV SAT receiver (without LNC) to make data link with Ethernet cards as PC interface.
The experimental socket on the table does not work because
IF band is ~27 MHz FM but video band after demodulation is only ~5MHz.
Then I replaced the clock cristals on the ethernet cards from oryginal 20 to 10MHz in direct connected PC to PC. But it did not work too.
Transmit signal seems to be good. I think the problem is in receive direction. It's caused probably by bad slave-receive clock on the ethernet card. Then I stoped further experiments. I hadn't got test equipment to answer that question.
Using 2Mbps modems G703 HDB3, link works correctly.
Do you have any experience in simple I/O electronic modules well cooperating with ethernet 10baseT card (tranceiver)
I would be intrested in electric schemas of such modules.
Merry Christmas and a happy new year!

Tadeusz Bienkowski SQ5BLP Warsaw Poland.

>The line out of the radio is connect by a cable to the line in of the
>sound card .

There are programs which allow the sound card and PC to act as a
modem, and there are programs which allow modem detected data to
be converted from packet to ASCII text, but I haven't seen a program
which does both. There may be something out there, but I haven't seen
it. There are programs which can do RTTY with a sound card since RTTY
has no special protocol which must be decoded. Packet does have such
a protocol.

Normally, to do packet you would use a TNC, which is a box somewhat
like a telephone modem which converts the tones from your radio to a
bit stream of 1s and 0s, and also does the protocol conversion from
packet HDLC frames to serial ASCII text which is then fed to your PC
on a normal serial port. The TNC has a microprocessor in it which is
programmed to deal with the packet protocol.

Another popular method uses a single chip hardware modem connected to
a status pin of one of the PC's serial ports, and a software program
called Baycom which then bit bangs the protocol conversion internally
in the PC. To use a sound card for packet, you'd need a program which
uses the sound card to emulate a modem, which can be computationally
intensive, *and* which does the packet protocol to message text conversion.
As I mentioned, I don't know of any such program, so what you are asking
may require original programming.

>the volume of line in of my sound card have some affect on decode the
>digital signals.
>
>I just hope you and everybody understand.

Yes, I understand what you are saying. The sound levels *do* matter,
and all the adjustments you mention can play a part in getting things
right. You must deliver enough audio to the A/D in the sound card so
that the tones have a good dynamic range, but you don't want to deliver
so much that the tones begin to distort or limit. You want to set the
radio volume control so that you have about 200-400 mV of audio going
to the sound card's line input. And you want to set the sound card's
internal level control, built into the sound card codec chip, to about
mid-range by software. That should be a good starting point.

Note that the sound card internal volume is controlled by software.
So the program you are using for decoding data will be the one to
control the internal audio level. The "mixer" application in Windows
will likely be *bypassed* by the application software, so its setting
should have no effect.

Yes, you're right, I had the hyphen out of place.

>I have an IC-R7100 and the only page about CI-V in the user manual
>describes how to set the baudrate and the device address, not the
>actual protocol or command information.

Oh, well the IC-706 owner's manual has it all, even the control words the
IC-706 doesn't understand.

>I have a copy of a manual that is shipped with the Icom CI-V interface
>and it has more detail about the protocol and some example programs,
>but no detail about the IC-R7100.
>So, when I would want to do some programming for my receiver I probably
>will need another document, maybe the service manual.

Well, you can just try all the possible control words and see which
ones your radio understands. Note, I have the service manual for the
IC-706 and it says *nothing* about the CI-V bus, so don't count on
the R7100 service manual having anything on it either. In fact, until
I got the IC-706, I didn't know how to use the CI-V bus with my
IC-735. There's zip in its manual. Now I can make both radios talk
with the computer.

>>It should be pointed out that the Icom C-IV system is not compatible
>>physically or programatically with the Yaesu CAT scheme, and neither

>
>Both schemes basically use TTL-level async serial I/O, and to interface
>them to the typical PC you need a MAX232 or equivalent level converter.
>In the Icom radios the receive and transmit share a single wire, on
>the Yeasu CAT they use separate wires. Other than that, the serial
>interfaces are identical.

Well, that's what I meant. You have to arbitrate the CI-V buss, you
don't with the CAT interface. It's like trying to use the up/down
mic buttons for frequency control, Icom uses a two level approach
on one wire while Yaesu uses a pull to ground and two wires. The
Yaesu approach is simpler.

>about $29-39 and is ready for use.
>How do you, folks, percept the whole project? Do you know anything
>more about it. How is it going to affect out community?

Well, here's my cut at it. There are two approaches being used with sound cards. One uses sound cards with on-board DSP, like the Cardinal cards with the Analog Devices chipset. With these, you can download a modem program to the DSP and let it run, then process the data with the PC's processor. By dividing the work this way, you can have a complex modem and not tax the PC. The downside is that sound cards with programable DSP are rare, and more expensive.

The other approach uses an ordinary sound card merely for its A/D and D/A capabilities and does all signal processing on the main microprocessor in the PC. This limits you to very simple modems unless the PC has a lot of horsepower. But PCs are gaining more horsepower every day, and a 200 MHz Pentium Pro is equivalent to a mid-level dedicated DSP processor. When the new PCs with microprocessors with MMX extensions hit the market in force, DSP on the main PC will become much better. I expect that eventually this will be the way all but the most advanced modems will be implemented.

I think this will be a good thing for the digital community in a couple of ways. First, we won't need a bunch of separate hardware boxes to do various digital methods. We'll just load a different program on the PC. And second, every ham will have a DSP development platform, his PC, and won't need all kinds of hardware development tools to do DSP development. This could lead to an explosion of new methods and new programs being developed. Out of that may come things better than we know how to do now with our hardware boxes.

For now, however, we still need a hardware assist for complex modems, like PACTOR II uses, and we still need high speed

digital interfaces, like the PI-2 card, for things like the
56 kb RF modem. No sound card can handle 56 kb yet, and
likely won't be able to in the future either because the
top sound card sampling rate is 44 kHz (like a CD), and
that's limited by Nyquist to handling signals no faster
than 22 kHz. There's no reason to offer a *sound* card
which can handle anything faster than that. (Multimedia
video accelerator cards might be pressed into service
for higher speed data, but they're pretty specialized and
might not have the required flexibility. I'm keeping an
open mind on that.)

Here's the port entry for the JNOS in our BPQCFG.TXT

```
PORT
ID=Link to GB7BBC-5
TYPE=INTERNAL
PROTOCOL=KISS
QUALITY=255
MAXFRAME=7
FRACK=7000
RESPTIME=2000
RETRIES=5
PACLEN=236
ENDPORT
```

And some bits from our "autoexec" that attaches the BPQ ports in JNOS

```
attach bpq init 0x7f 62
#
# This is the port (our port 4) referred to in the BPQCFG.TXT
attach bpq 4 node
#
# Now let JNOS work across this BPQ radio port (our port 1)
attach bpq 1 ax1
```

N.B. PACLEN in the BPQCFG.TXT is set at 236 !!

Hope this helps.

73, Gareth.

The FCC, respondig to numerous petitions filed by the ARRL and other organizations has postponed implementation of the new RF safety rules until September 1997. Under the new rules, Amateurs must certify the RF safety of their stations if they operate at 50 watts or more output power.

The complete story is available at http://www.hamradio-online.com

I would suggest getting a Flash card and placing APRS on it for the
HP200LX. One side note, map drawing on the HP200LX is painfully slow.
Other than that, it works great.

Since you wrote the software, maybe you know an answer...?

We have 2 pentium's 120 using the baycom modem to connect too each other, one running linux kernel 2.0.18 and one 2.0.27. After some experiments the link is running a little bit with ax25 tcp or netrom, but in both cases we have ploblems. When using telnet or ftp we can have a connection but just before or sometimes after the login session the connection gets disturbed by losing a packet. This packet will be repeated a few times but the connection stops and it seems that the 2 computer can't figur out how to continue. When we start a ping or another program this will start on the same link but the first session just dies or resumes only after 5 or 10 minutes. Any idee's?

We know there are problems with pentium motherboards, in fact we use a separate 16550 multi-iocard in one of the computers for this reason.

> If you're _really_ looking for something small, use your laptops sound
> device.

I haven't found a link to this sort of software, did i overlook something?

I just purchased the Garmin 45XL with the data cable and did the old resistor "pull down" trick on the gps to computer line and the NEMA data is going to the computer just fine. I then took a resistor and a diode in series with a zener to ground to change the -12 to +12 to 0 or +5 for the computer to the gps. This works great on loop back test ect. Delorme Street Atlas 4.0 and Map Expert both read/write waypoints to the GPS and I can't seem to get these features working. The tracking functions work great. Are the other control lines of the RS232 being used? Anybody with any input I would appreciate it. Please e-mail below.

I used the control cable wired directly to the com port (via a
connector, of course) and didn't need a pull-down resistor. I have
the GPS 45 connected to a laptop and use it with Map Expert, but so
far as I know, it doesn't read or write waypoints. What makes you
think it does?

IAC, there are no other lines used.

I use a Garmin 65 connected directly to a PC serial port with no
resistors, diodes, or other level translation scheme - works just fine
with both my desktop and notebook computers.

To transfer waypoints, the Garmin receivers must be set to use Garmin
protocol, not NMEA.

You might want to look at the Garmin45 FAQ, and the info on NMEA
interfacing, in my ftp directory (URLs below) (also programs for Garmin
comms and NMEA display...)

>I could contact to obtain one.
>
Yes it's true. The cable has a small pcb enclosed in the 25pin D
connector, mounting a simple limiter amp. e.g. 741. This is powered from
spare lines on the COM port.

The software - HamCom - drives the lines high + and low - for the rail
supplies and it polls a line from the amp. output at high speed. It senses
data present and calculates validity and data value from the results. This
can be code, rtty, hffax, etc.

Message-ID: <32C20FBE.149D@3-cities.com>
Source record: 32764

Wondering if someone has a solution for minimizing the buzz on the computer speakers when the radio transmits a packet.

Am using a Radio Shack HTX 212 with a Kantronics KPC-3. Have the radio set at low power-10 watts output. Evertime the TNC commands a packet transmission I hear a buzz over the speakers. I have the TNC and radio setting on top of my computer tower which is along side my monitor. The speakers are on a shelf above the computer. All the leads for the computer, radio, speakers, power, and telephone are in a big tangled mess behind the system.

Any ideas?

I guess I need to find a copy of that manual, then.
I still think it is strange that one needs the manual of a recent transceiver
to be able to controle one's (older) receiver, but well...

Richard,
Check this page:

http://www.concentric.net/~n9zle/hc.html

Bruce, N9ZLE sells the hardware interface you need, and will give you the
HamComm/JVFax shareware you need to make it work. It plugs into a
serial port on your computer, copies CW, RTTY, PACKET (crude form), SSTV,
and WEFAX pictures. It costs a whopping $20 usually, but they are on sale
for $15 for Christmas. Once you get the software, there are schematics in
the DOC files to show you how to build other interfaces if you are interested.
I bought one a few months ago, and use if for HF WEFAX pictures, and it
works great. Be aware that there isn't any hardware that copies 'perfect'
CW. How well any of the hardware devises copy is very dependent on the
strength of the received signal and the way the CW is being sent.

>taking a pair of cards and replaced the clock with a signal generator
>and decreased the frequency to see where things fail.

Of course the pulse transformer may cause some lower limit.
(it cannot transfer DC so there must be some frequency at which it can
no longer adequately transfer the manchester-encoded data)

I agree that it is unlikely that the chip has any problem with a small
reduction in clock frequency. The designer probably was thinking about
the limits of the clock frequency *while talking to a standard ethernet*,
which are probably fairly tight.

Things that could cause problems:
- dynamic memory or other dynamic design inside the chip
- clock recovery circuits using filtering or a VCO not depending on the
clock frequency, but based on analog circuits (partly) integrated in
the chip
- in the case of ISA-special chips: the chip might not expect that the
busclock (8 MHz) is higher than the chip clock (usually 20 MHz for
10 Mbit/s operation)

A dynamic design that was meant for 10 Mbit/s and designed with all kinds
of safety margins will probably work "ok" for amateur use at 2 Mbit/s.
When you use an "old" card with a general-purpose ethernet controller
chip, the bus clock should not be a problem. It might be with those
"everything in one square block" controllers? But those were not common
at the time the original comment was written.

From: "Brian K. Short" <ke7gh@primenet.com>
Message-ID: <32C40FB1.52F0@primenet.com>
Source record: 32782

Please excuse the negative tone of this information, but I am just forwarding it and folks do seem quite interested.

I do not know of a "replacement" journal." QST Jan 1997 had a nice review of the SCS PTC-II Pactor II controller. They have had several advanced digital articles lately. I have not seen nearly the coverage of Clover ANYWHERE else...

I personally will miss the "RTTY Journal." I received it back in the 80's and while not a glitzy, glossy publication at that time, I enjoyed reading it. As you know, the "RTTY Journal" has been around for quite a number of years (I've only been a ham since 1974 myself).

Many have commented about the economic realities of amateur radio organizations (shrinking numbers, reluctant sponsors), but also there has been a large trend to distribute information (more quickly and also more efficiently) via internet. Internet provides EVERYONE with access to "publish." There really are no editors/censors etc on internet (for good or bad).

Personally, if anyone has information of publication quality (or otherwise),
I would be happy to include it in my web page(s) or include a link.

73, Brian http://www.primenet.com/~ke7gh/

All I know is that I --and presumably everyone else-- received a plaintive plea for support from IDRA/DJ earlier this month, with the declaration that the mag was gg bimonthly. I responded with a show of faith-- a check for $32.

So, on the one hand, we have a statement about reorganization and staff changes and a plea for support, answered in my case. On the other hand, we have a flat statement from the departing Editor that the show is over.

Which is it, please?
--
Garry Shapiro, NI6T
Editor, The DXer

I don't want to seem like a Monday morning quarterback, but...

I seem to recall in a recent DJ, there were comments about paying off debt ahead of schedule (correct me if I'm wrong).

I'm no economist, but I do run small business. The way I see it, one
should not retire debt early, unless there is an ABUNDANCE of cash
flow. If anything, debt should be refinanced to extend the term and
decrease each payment, to try to salvage the company during a cash
flow crunch.
Can anyone explain?

Could be, but there was a whole generation of ethernet cards after
the 3c501 that used general-purpose ethernet controllers.
These include the 3c503, wd8010, ne2000 etc etc.

What I meant by "everything in one square block" controllers are cards
like the 3c509.

Jim, I have use PKgold, KAgold and Pkdualport all by Interflex. Kagold
the longest, with great results. The support, don't think you will find
none better...The test drive is ok to get a feel for what it can do.

Yes it can be done with just one op-amp and a PCB
the size of the RS232 connector. Get Hamcomm (see below)
there is a schematics inside for simple and more complex
interfaces.

http://oak.oakland.edu:8080/pub/hamradio/arrl/bbs/programs/hamcom31.exe

There is also on the Web someone selling some cheap interfaces for
Hamcomm (never tested one but must be a one op-amp solution too)

6784. IC-706 computer control interface electrical specification

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-27 00:00:00 UTC
From: Rick Davis <rdavis2@itouch.net>
Message-ID: <32C48B97.1432@itouch.net>
Source record: 32788

Does anybody know what the electrical spec is on the IC-706?
It looks like a three wire interface using a 1/8" stereo
plug. I would assume that the signals are TXdata, RXdata, and
Ground. I would also assume that these are TTL levels.
Can anybody confirm this and identify the pins of the plug?
Thanks in advance.

>Can anybody confirm this and identify the pins of the plug?
>Thanks in advance.

It is a 2-wire interface. Tip is CI-V data in/out and ring
is common. The levels are TTL. Icom uses a bus structure,
sort of like ethernet, for control. You need an interface
to convert this bus information to RS-232 levels and separate
the Tx and Rx signals for the computer. Icom sells the CT-17
interface for this (it is sort of like an ethernet MAU).

The message format from the interface to the radio is as follows:

FE FE 48 E0 Cn Sc |data area| FD

The two FE bytes are the frame preamble, and must be present on
every frame to or from the radio.

48 is the default IC-706 address. This can be changed in the
initial set menu if more than one radio will be on the same
CI-V bus.

E0 is the default controller address, this can be changed in
the CT-17 if more than one controller is on the same bus.

Cn is the command number byte. See command table.

Sc is the subcommand number byte. See subcommand table.

The data area is for commands requiring data, such as
direct frequency entry or memory channel selection.
It is coded in BCD, and may be of variable length depending
on the command issued.

FD is the end of message code and signals termination of
the frame. Every frame must terminate in FD.

The radio will respond to a message from the controller in
one of three ways. If it offers no reply, that means it didn't
detect a frame at all. Otherwise it will reply with a OK message
for a valid command or a NG message for an invalid command. Their
formats are fixed (except for radio and controller address bytes,
which will depend on the particular radio and controller conversing

on the bus at the moment) and are as follows.

OK message:

FE FE 48 E0 FB FD

NG message:

FE FE 48 E0 FA FD

The radio can also send information to the controller. The
format is similar to the frame format from the controller to
the radio. The key difference is that the positions of the
address bytes are reversed, IE

FE FE E0 48 Cn Sc |data area| FD

The data area is optional, and is used for commands requiring
information responses, IE what frequency the radio is currently
on or what memory channel is currently active, etc. No acknowledgement
is expected from the controller.

Note that this isn't ASCII data. The bytes are all Hex values,
and the data area is coded as BCD digits, IE 4-bit values.
By default, the IC-706 uses 5 bytes, IE 10 digits, for frequency
data, but that can be changed in the initial set menu to 4 bytes,
IE 8 digits, if an IC-735 is sharing the same CI-V bus. The initial
set menu can be used to select the baud for the CI-V bus. Default
is 19.2 kb.

>Timothy
>KD4IKY

Well, lets see what you need. For mode U/V (the old mode B), you'll need a 70cm Tx and a 2m Rx. Now an easy way to get these is with transverters from a 10m rig (or an old SSB CB). The latter can be had cheap if you don't already have something for 10m. You don't have to convert it, you can choose the crystals in the transverters to go direct to and from CB frequencies. You'll want to mod it to allow enough RIT range to cover between channels, and to allow XIT as well. This is usually pretty easy to do. Down East Microwave sells suitable transverter kits, or you can build from scratch based on the designs in the RSGB VHF/UHF Dx Book. A preamp will be needed, and the ARRL Handbook and the Proceedings of the Central States VHF Conference (available from ARRL) have several suitable designs.

Another approach is to build a 2m Rx and 70cm Tx. The Rick Campbell R2 and T2, described in a QST series and in newer Handbooks, are suitable for this. Kanga sells kits, but these radios are simple enough to build dead bug style. The R2 and T2 are universal designs which can be made to work from LF up through UHF (up to 500 MHz anyway). They use the phasing method to generate SSB and to obtain single signal reception. You have to supply the LO. A VXO and multiplier should do fine. You can find suitable VXO designs in the Handbook. A good mast mount preamp will be required for receive, and any of the ones referenced above should work fine. You'll need a PA for the Tx. RF Parts sells suitable brick amps, as does Down East Microwave. Depending on antenna gain, you'll need from 10 watts to 100 watts uplink power. Err on the side of too much, you can turn it down if you wind up louder than the beacon.

(Note that you can set the R2 and T2 up for 10m and use transverters, as with the CB set recomendation above, if you prefer. There are some advantages to this approach, though it adds some complexity and cost.)

If you'd like to try your hand at digital via the satellite. A suitable receiver for 9600 baud on P3D and the Microsats can be made from a GE UHF Exec II or Mastr II receive strip. Use the temperature compensation input of the Icom (channel element) for doppler tracking. These Rx strips can be found at hamfests for $25, or $50 for a complete radio. The UHF Tx strip can be used as a CW transmitter for mode U/V as is. With 80 watts output, they do great. For data uplink, a VHF version of the Tx strip can be modified for 9600 baud. Disable the PM modulator and use the temperature compensation input to the Icom for modulation (or rewire to use a Motorola channel element and modulate that, it's a bit more linear).

If you prefer to scratch build the FM setup, a receiver based on the MC13135 receiver subsystem chip, and a Tx based on the MC2833 exciter chip, are pretty easy to do. Add a power brick from RF Parts, and you're on your way. Converting the business band radios is so easy and cheap, though, it is really the better way to go.

P3D will have many more modes. Setting up for them will require either more transverters or more radios. Mode U/V and the Microsat style 9600 baud digital mode will likely the be the most popular in the beginning, however, because everyone equipped for Oscar 10 and Oscar 13 will already be set for mode U/V and all the Microsat ground stations will be set for 9600 baud data.

You'll need a pair of steerable yagis or helixes, for mode U/V. You can build these yourself and save a bunch of money. When the sat is near apogee, it hangs in virtually the same spot in the sky for long periods, so you can aim the antennas by hand, no need for auto-tracking, or even for rotators. The antennas don't have to be very high off the ground, since they are looking up. You can use a tripod or post mount and turn them directly by hand as needed. The antennas can be made from a length of 2x2 and use aluminum clothesline wire for elements. There are a number of antenna programs available on the net which can optimize the design for you.

It doesn't have to cost gobs of money to get on the satellites if you use a little ingenuity. You can be on the digital birds for under $100, or on U/V SSB for a bit over $300, if you scrounge and adapt a bit.

Here's my theory. Suppose you own a business that has some cash around,
a bit of debt, but you see very little opportunity for profits in the future.
How do you get out now before everything implodes? I'd say, you pay off
as much debt as possible, close the shop, to cut costs and sell off as
many assets as possible. With luck you won't stiff anyone and will live
to fight again. Running these things into the ground is, imo, not the
best way to go as you'll take suppliers down with you.

I thought Borland C3.0 included TASM. Are you sure that you don't have
Turbo C++ instead of Borland C++? In any case, since some of the newer
versions do not include TASM, the assembled .obj files are available
from the JNOS site, pc.usl.edu for the later versions of JNOS (1.11x5 is
the newest version).

Try running 'make' from the directory which has the source, rather than
using IDE. Be sure that /borlandc/bin is in your path. You will need
to edit makefile to put in the right compiler version and path, as well
as processor version.

6797. Maybe YOU can help with MYSTERY box !!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-28 00:00:00 UTC
From: John Christian <hugejohn@ix.netcom.com>
Message-ID: <5a2843$qlo@dfw-ixnews8.ix.netcom.com>
Source record: 32795

We recently came back from an older family members house with a little mystery device. No one knows what it is and we'd like to find out. Here's a description of what we found:

It is a rather small wooden box with a laquered finish. It is about 11" wide by 12" deep by 9" tall. The top is not perfectly flat on top, instead it has a slight roll in it from back to front -presumeably asthetics. (It seems to be circa '50's)

On the top is what looks sorta like a rotary telephone dial only slightly larger (and it's not a telephone dial). There is a circle of finger depressions around the edge of the plastic disk. Corosponding to the finger depressions are recessed clear plastic rectangular slots. Some of the slots have four letter station identifiers under them (not sure if TV or Radio) while some are just blank. There is also a triangular piece of plastic that acts as a finger stop when you turn the dial. This 'finger stop' is spring loaded and can be pressed down (with no effect on the turning disk).

There doesn't seem to be ANY places for wires, plugs, jacks, etc. on the outside.

The bottom unscrews so we opened it up and on the inside found...

Connected to the rotary dial is a set of gears that spin a flat rectangle of metal. The gearing is a very low input to high output ratio (in other words, for each turn of the dial, the metal piece spins A LOT of times)

The gears and the spinning metal piece are not mechanically connected to any other stuff, nor are they wired to anything.

Encircling (but not attached to) the spinning piece of metal, is a flat ring of [?]. It's either a flat piece of metal rolled into a circle, or a wrapping of thin wires. This ring is wired to some things mounted on the base of the device.

Mounted to the bottom is a heavy, blue cardboard box with the name "Philco" printed on it. It appears to be a battery (maybe?) and is wired in. There is also some sort of rheostat that can be adjusted from the outside by inserting a screw driver in a small hole on the bottom. Also wired in is a (I presume) vacumm tube.

This thing is completely self contained. There does not seem to be any way for the device to communicate with another device (again, no places for plugs, wires, etc.) nor does there seem to be any way for the device to communicate with people.

ANY SUGGESTIONS OR IDEAS ???

The only suggestion we've had so far is that it might be a TV channel direction finder.

Thanks in advance for any help or ideas!!

-John

You'll want to mod it to allow enough RIT range to cover between channels, and to allow XIT as well. This is usually pretty easy to do. Down East Microwave sells suitable transverter kits, or you can build from scratch based on the designs in the RSGB VHF/UHF Dx Book. A preamp will be needed, and the ARRL Handbook and the Proceedings of the Central States VHF Conference (available from ARRL) have several suitable designs.

Another approach is to build a 2m Rx and 70cm Tx. The Rick Campbell R2 and T2, described in a QST series and in newer Handbooks, are suitable for this. Kanga sells kits, but these radios are simple enough to build dead bug style. The R2 and T2 are universal designs which can be made to work from LF up through UHF (up to 500 MHz anyway). They use the phasing method to generate SSB and to obtain single signal reception. You have to supply the LO. A VXO and multiplier should do fine. You can find suitable VXO designs in the Handbook. A good mast mount preamp will be required for receive, and any of the ones referenced above should work fine. You'll need a PA for the Tx. RF Parts sells suitable brick amps, as does Down East Microwave. Depending on antenna gain, you'll need from 10 watts to 100 watts uplink power. Err on the side of too much, you can turn it down if you wind up louder than the beacon.

(Note that you can set the R2 and T2 up for 10m and use transverters, as with the CB set recomendation above, if you prefer. There are some advantages to this approach, though it adds some complexity and cost.)

If you'd like to try your hand at digital via the satellite. A suitable receiver for 9600 baud on P3D and the Microsats can be made from a GE UHF Exec II or Mastr II receive strip. Use the temperature compensation input of the Icom (channel element) for doppler tracking. These Rx strips can be found at hamfests for $25, or $50 for a complete radio. The UHF Tx strip can be used as a CW transmitter for mode U/V as is. With 80 watts output, they do great. For data uplink, a VHF version of the Tx strip can be modified for 9600 baud. Disable the PM modulator and use the temperature compensation input to the Icom for modulation (or rewire to use a Motorola channel element and modulate that, it's a bit more linear).

If you prefer to scratch build the FM setup, a receiver based on the MC13135 receiver subsystem chip, and a Tx based on the MC2833 exciter chip, are pretty easy to do. Add a power brick from RF Parts, and you're on your way. Converting the business band radios is so easy and cheap, though, it is really the better way to go.

P3D will have many more modes. Setting up for them will require either more transverters or more radios. Mode U/V and the Microsat style 9600 baud digital mode will likely the be the most popular in the beginning, however, because everyone equipped for Oscar 10 and Oscar 13 will already be set for mode U/V and all the Microsat ground stations will be set for 9600 baud data.

You'll need a pair of steerable yagis or helixes, for mode U/V. You can build these yourself and save a bunch of money. When the sat is near apogee, it hangs in virtually the same spot in the sky for long periods, so you can aim the antennas by hand, no need for auto-tracking, or even for rotators. The antennas don't have to be very high off the ground, since they are looking up. You can use a tripod or post mount and turn them directly by hand as needed. The antennas can be made from a length of 2x2 and use aluminum clothesline wire for elements. There are a number of antenna programs available on the net which can optimize the design for you.

It doesn't have to cost gobs of money to get on the satellites if you use a little ingenuity. You can be on the digital birds for under $100, or on U/V SSB for a bit over $300, if you scrounge and adapt a bit.

I have an I/O card with 75150 / 75154 rs232 driver/receiver chips. This
card does not work with the TTL voltages from the Garmin. Pull down
resistors are necessary in this case.
These serial ports are designed to comply with the rs232 standard. (
-15V<U<-3V, +15V>U>+3V)

Of course i swapped the card for a Chinese one that had no problem with
TTL...

According to an AEA press release, "AEA is presently in the process of selling its three product lines (Data Products, Test Analyzers, and Antennas) to three different companies"... "The new parties will likely offer warranty and out-of-warranty service to old AEA customers."

I understand the employees are laid off and the doors are closed. Unless the new parties hire back the old employees, I wonder what kind of service we will get.

>
>Does anybody have any experience with this sort of thing? Could harmonics cause
>interference at either 1150Mhz or 4000Mhz? A scan by a good spectrum analyser
>did not pick up anything unusual at either frequency though.

Most spectrum analyzers have a floor sensitivity of around -100 dbm. The satellite signals you are receiving have a signal strength on the order of -170 dbm. So interference which could wipe out the satellite signal could be below the noise floor of the spectrum analyzer. Harmonics or IMD products are almost certainly causing your problem, but they can be very weak and still cause problems to the very very sensitive satellite receiver.

This is a clue, however. If the shielding integrity of your system is good, the interference shouldn't be on the 1150 MHz IF frequency. The problem is likely to be directly on the 4 GHz frequency of the LNB. That's the first major gain block of your system, and is most responsive to very weak signals.

>I believe the purpose of these large "gateway boxes" (spaced approx 1 for every
>1500 houses) is to feed the fibre optic signal into the main coaxial cable,
>which then feeds into each individual house.
>
>I don't know about these things but can harmonics at these frequencies be
>generated by this "conversion" process (FO -> Coax) or would the power supply of
>the unit be more likely the cause?

Neither. These boxes have line amplifiers in them which amplify the cable system signals feeding down the coax to individual homes. The signals have to be quite strong because they will be divided so many ways to feed all those homes. The signal level coming out of the box will be on the order of +33 dbm, IE a couple of watts. Now this is a linear amplifier with a very broad bandwidth, IE the entire TV frequency spectrum, and it has signals to amplify across that entire spectrum. Like any linear amplifier, it is not perfect. It will have IMD products and harmonics in its output. A good CATV amplifier will have IMD and harmonics held down -60 db from the fundamental, but that's still a -27dbm signal (-27dbm would be the combined output of all products, not the level of the individual product interfering with you, that would be lower, but still strong enough to cause a problem).

Cable systems depend on cable integrity to prevent these unwanted
products from escaping their closed systems. But that isn't perfect
either. Cable leakage is a perennial problem with CATV systems. Any
imperfect connection anywhere in the system can allow the unwanted
signals to leak out with sufficient strength to interfere with your
very sensitive receiver.

>Of course, I'm particularly interested to hear of possible remedies to stop
>whatever is coming out of these boxes from reaching my dish (about 100 metres
>away). If the cable tv company let me I'd go up there myself and line the inside
>of the box with aluminium foil or lead sheeting. Don't think that is likely.
>
>Any suggestions?

First, are you *sure* the leakage is coming *directly* from the box,
or is it perhaps being radiated from the cable feeder somewhat closer
to your receiver? The most likely points of leakage are where there
is a connector in the cabling. There's one of those at each house
drop. And often the leakage is actually from customer provided wiring
and equipment *inside* of a house. It would be unsuual for the box
itself to be the primary source of leakage.

If you are sure the leakage is coming from the box itself, and the
box is 100m away, then erect a shield fence between the box and
your dish. Use mesh, commonly called "rabbit wire" for the fence.
We often have to do this at TVRO sites to prevent off premises
signals from interfering with our commercial receiving sites.
This perimeter fencing serves double duty as a RF shield for
off premises signals, and as a security barrier for the site.
Space the fence about twice the dish diameter from the dish.
At 4 GHz, a barrier fence taller than the dish will offer over
30 db of attenuation to line of sight interference signals at
ground level. That'll probably be enough to solve your problems.

>modems will be implemented.

That's the MAIN TARGET.

All you need is a programmer to get is hands dirty.
(BTW I am C/C++ Intermediate/beginner Level Programmer :-)
My problem is I cann't say the same to HAM, digital signals,
and DSP :( )

>I think this will be a good thing for the digital community
>in a couple of ways. First, we won't need a bunch of separate
>hardware boxes to do various digital methods. We'll just load

>a different program on the PC. And second, every ham will have

>developed. Out of that may come things better than we know
>how to do now with our hardware boxes.

Agree, the biggest problem I think there is in decode digital
signals is on the receiver/transreceivers because they have
a interface for control the receiver/transreceiver BUT, normally
thosen't have OTHER interface for receive the Digital Signals and
decode them, If WE have this, thing go much easyer, and the
horsepower of the PC (also the software) will do all.

Why do not HAM's/scanners begin to request to receiver/transreceivers
manufactors to include a dsp processor and other interface for RX/TX
of digital signals? It's not a bad idea(I think)?

RS232C speed limit 115.2kBits/S

>For now, however, we still need a hardware assist for complex

>that's limited by Nyquist to handling signals no faster
>than 22 kHz. There's no reason to offer a *sound* card
>which can handle anything faster than that. (Multimedia
>*video* accelerator cards might be pressed into service
>for higher speed data, but they're pretty specialized and
>might not have the required flexibility. I'm keeping an
>open mind on that.)

I have to agree it's very limit, I just hope my previous
idea will help.

BTW take a look at this

URL http://www.winradio.net.au

It's fantastic ... this is a PC card that received radio signals
from 500khz to 1.3Ghz, with software to control the card, and there
is also a api spec if you want to make your own software to control
the card.

If a card like this ALSO have a DSP processor built-in or other
PC card with a DSP processor with a connection for a audio cable from
the record line out of a receiver or transreceiver ... well, I think
that you get the picture.

Now this is a linear amplifier with a very broad bandwidth, IE the entire TV frequency spectrum, and it has signals to amplify across that entire spectrum. Like any linear amplifier, it is not perfect. It will have IMD products and harmonics in its output. A good CATV amplifier will have IMD and harmonics held down -60 db from the fundamental, but that's still a -27dbm signal (-27dbm would be the combined output of all products, not the level of the individual product interfering with you, that would be lower, but still strong enough to cause a problem).

Cable systems depend on cable integrity to prevent these unwanted
products from escaping their closed systems. But that isn't perfect
either. Cable leakage is a perennial problem with CATV systems. Any
imperfect connection anywhere in the system can allow the unwanted
signals to leak out with sufficient strength to interfere with your
very sensitive receiver.

>Of course, I'm particularly interested to hear of possible remedies to stop
>whatever is coming out of these boxes from reaching my dish (about 100 metres
>away). If the cable tv company let me I'd go up there myself and line the inside
>of the box with aluminium foil or lead sheeting. Don't think that is likely.
>
>Any suggestions?

First, are you *sure* the leakage is coming *directly* from the box,
or is it perhaps being radiated from the cable feeder somewhat closer
to your receiver? The most likely points of leakage are where there
is a connector in the cabling. There's one of those at each house
drop. And often the leakage is actually from customer provided wiring
and equipment *inside* of a house. It would be unsuual for the box
itself to be the primary source of leakage.

If you are sure the leakage is coming from the box itself, and the
box is 100m away, then erect a shield fence between the box and
your dish. Use mesh, commonly called "rabbit wire" for the fence.
We often have to do this at TVRO sites to prevent off premises
signals from interfering with our commercial receiving sites.
This perimeter fencing serves double duty as a RF shield for
off premises signals, and as a security barrier for the site.
Space the fence about twice the dish diameter from the dish.
At 4 GHz, a barrier fence taller than the dish will offer over
30 db of attenuation to line of sight interference signals at
ground level. That'll probably be enough to solve your problems.

"WE'RE BACK", "DXER.COM" "Your Ham Radio Resource Site"
is back on line and ready to provide you with the most
comprehensive ham radio related site on the Internet...

Stop by and check it out..29 indexes. Everything from
DX Clubs, EME, Packet Radio, Scanners, Shortwave, QRP,
Maritime, Callbooks, Contest Calendars, Software, Clusters.
Radio Modifications, Sarex, Mir, MARS and many others.
Many more links have been added and we are now approaching
500 links, with more to come...

In addition to the interactive BBS, we will be adding in
the near future a Ham E-Mail Callbook...

Stop on by "http://www.dxer.com" and let us know what you
think, and what you would like to see added to the ever
growing list of links..

>Does anybody know what the electrical spec is on the IC-706?
>It looks like a three wire interface using a 1/8" stereo
>plug. I would assume that the signals are TXdata, RXdata, and
>Ground. I would also assume that these are TTL levels.
>Can anybody confirm this and identify the pins of the plug?
>Thanks in advance.

It is a 2-wire interface. Tip is CI-V data in/out and ring
is common. The levels are TTL. Icom uses a bus structure,
sort of like ethernet, for control. You need an interface
to convert this bus information to RS-232 levels and separate
the Tx and Rx signals for the computer. Icom sells the CT-17
interface for this (it is sort of like an ethernet MAU).

The message format from the interface to the radio is as follows:

FE FE 48 E0 Cn Sc |data area| FD

The two FE bytes are the frame preamble, and must be present on
every frame to or from the radio.

48 is the default IC-706 address. This can be changed in the
initial set menu if more than one radio will be on the same
CI-V bus.

E0 is the default controller address, this can be changed in
the CT-17 if more than one controller is on the same bus.

Cn is the command number byte. See command table.

Sc is the subcommand number byte. See subcommand table.

The data area is for commands requiring data, such as
direct frequency entry or memory channel selection.
It is coded in BCD, and may be of variable length depending
on the command issued.

FD is the end of message code and signals termination of
the frame. Every frame must terminate in FD.

The radio will respond to a message from the controller in
one of three ways. If it offers no reply, that means it didn't
detect a frame at all. Otherwise it will reply with a OK message
for a valid command or a NG message for an invalid command. Their
formats are fixed (except for radio and controller address bytes,
which will depend on the particular radio and controller conversing

on the bus at the moment) and are as follows.

OK message:

FE FE 48 E0 FB FD

NG message:

FE FE 48 E0 FA FD

The radio can also send information to the controller. The
format is similar to the frame format from the controller to
the radio. The key difference is that the positions of the
address bytes are reversed, IE

FE FE E0 48 Cn Sc |data area| FD

The data area is optional, and is used for commands requiring
information responses, IE what frequency the radio is currently
on or what memory channel is currently active, etc. No acknowledgement
is expected from the controller.

Note that this isn't ASCII data. The bytes are all Hex values,
and the data area is coded as BCD digits, IE 4-bit values.
By default, the IC-706 uses 5 bytes, IE 10 digits, for frequency
data, but that can be changed in the initial set menu to 4 bytes,
IE 8 digits, if an IC-735 is sharing the same CI-V bus. The initial
set menu can be used to select the baud for the CI-V bus. Default
is 19.2 kb.

Greetings, all...

There have been hiccups in the Digest distribution, somewhere between my provider (massey.ac.nz) and ucsd.edu, and I am missing the following Digests:

486
492
495 and
516

They are not in the archive: the script only processes one Digest per day. I archive these for local Hams, and try my best to get them all... and one or two of the current threads are of interest to me. Has anyone trapped these, who could email them to me (Mime attachments OK)?
This is a second posting: I had no replies earlier, and 516 has since slipped through the cracks...

The CI-V interface is a basically open interface. ICOM throw it out there for others to use. TenTec uses the ICOM designed CI-V interface along with Optoelectronics.

Generally most ICOM radios default at 1200 baud, not 19.2 KBaud. The nice this about the CI-V interface is you can chain many radios together at one time.

Think of a contest station where one computer does all the logging and all the radios report to that one computer at the same time. All the program needs to do is to poll the various radios that are attached as they are sorted out using a different address for each radio.

Boy, I stumbled across one of these things as a kid -- and it was old back
in the 70's. I figured it was part of a radio back then, though I didn't have
the radio to go with it.

Anyway, the mystery for me was solved when I saw an old movie, I don't remember
the name of it unfortunately, where they had exactly the weird phone
type control you describe. And they use it to tune in radio stations.
I'll bet it keys some kind of relay device in another box to pick
which station you want to listen to. Kinda' silly, really.

6823. Sound Blaster uses for Hams

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-29 00:00:00 UTC
From: Regev Oded <4Z5BS@haifa.ampr.org>
Message-ID: <32C658ED.41C67EA6@haifa.ampr.org>
Source record: 32677

Hello !

I have been working lately on developing
software for using the Sound Blaster.
I have already written a Sound Blaster
interface for JVFAX. It can receive ALL the
modes, Fax Sstv even AM-FAX from satellites.
The JV-FAX program by DK8JV has many advantages
such as GIF file format and compatibility with
many screens etc.

The interface itself requires no additional harware
except some wires to connect your Sound Blaster
to the TX/RX. (Even a microphone works
but highly unrecommended)

I am looking for the EMAIL address of DK8JV to ask
him some questions I have about the interface. I hope
someone can help me find him and I'll be able to release
the program then.

Another thing I've been working on is trying to
receieve some Packet modes. I saw a program that
does that with 1200 and 9600 baud. So I wrote
a BPSK decoder. It works well at times but it has difficulties
in achieving a constant lock on satellite signals (Doppler
is the problem).

If anyone has a source code for a good BPSK decoder
I would appreciate if you will send me so I'll be able
to complete the decoder. Another thing I need is
a development kit for FlexNet. FlexNet is the program
that allows such decoders to be easily interface with
programs like GP, SP, TPK... I don't know where to get
it and until then I only see the received packets on
the screen without any program really seeing the information.

Hello.
I've just updated my FTV program, which does FAX & SSTV using a SoundCard, to decode Baudot using the same (FM) demodulation engine.

Here is a run down of the more interesting features:

(1) It keeps the demodulated signal in memory, so that the signal can be analysed again at a different keying rate or polarity! Garbage can be resampled on the fly, which means that minutes of received signals decoded at the wrong baud rate or keying polarity are recovered, on the fly, while still receiving.

(2) Keying rate and polarity are analysed automatically - standard baud rates are automatically set following analysis.

(3) Tuning oscilloscope available at all times, without loss of copy.

(4) Program works in real time.

(5) I wrote it, and I love it - I myself can't believe it works so well!

Download your copy of FTV from my web site, at:
http://www.geocities.com/SiliconValley/2504

System requirements, and the standard features of FTV are described in the following page:
http://www.geocities.com/SiliconValley/2504/ftv.htm

By the way, AM signals from low orbiting weather satellites are also decoded - no extra interfaces needed. Demodulation mode is user selectable in software.

Hope you all have a load of fun receiving 'words and pictures' - I hope to get some feedback !

Happy New Year 1997
All the best from Brian, 9H1JS, on the Island of Malta.

6832. Kansas City Packet---What happened?

Newsgroup: rec.radio.amateur.digital.misc

I've been off Packet for a number of years---mainly due to the congestion. Well, I moved a month ago and the only mode I now have, until spring, is VHF and VHF packet. Three years ago 145.01,.05,.09 was full, now I hear only 3-4 stations after listening for hours. What's happened to packet while I was gone?

I have had two Pentiums, both of which worked fine with the Baycom, both with 16550 UARTs, so you are mistaken I am afraid. You may be driving the modem too fast (ie trying to stuff the data into the Baycom at 115K or something), or the software you are using may not run properly under Windows (most, but not all, of it doesn't). See my seperate reply in this thread to another post for info on this subject.

I've done it. Most software doesn't work properly, for the reasons
stated (and snipped to save time). However, G7JJF's WINTNC program
performs perfectly under Windows 3.x, 95 & NT 3.51. It's quite a nice
little program, and very easy to configure. It is available from G7JJF
@ GB7MAM.#23.GBR.EU or by emailing him at jon@g7jjf.demon.co.uk. It is
on the WWW somewhere, but I can't find the url right now. there is
also a nice little program called mdmtest (modem test) which, er,
tests the baycom modem for you. If you can't find it, let me know and
I'll stick it on my own web site for you.

>running as the software for the baycom requires the computer to constantly
>monitor a port for changes, and then translate it. Be grateful you have
>the PK232, but if you're determined to have something to carry around, the
>TINY 2 from PACCOM, or the KPC-3 from kantronics are much better choices,
>and don't produce errors like trying to use a baycom modem with an
>operating system or two that demand most of the computer's attention. In

>the baycom software, good luck. I also remember one chap claiming that he
>had JNOS, the tcp/ip software running a baycom modem under win95, but he
>never explained how he got it to work, and I can't for the life of me
>remember his call.

My opinion is definitely the opposite - stick with the baycom. They
are versatile & cheap, and I could never see the point of spending
hundreds of pounds / dollars on a sophisticated TNC to connect to a
computer which is twenty times more powerful. Plus you've got one

already of course.

One thought - have you ascertained that the your Baycom works, by testing it with another amateur perhaps? I built mine from a Badger Boards kit, and there was a mistake in the design which meant that it wouldn't work. It took me weeks to figure it out.

Regards

Graeme

I wonder how many answers you get. The device that you have is the remote control unit for a Philco radio that was built in the 1940's. Starting in about 1939, push button radios were the latest novelty. Philco made one and only one radio which had a radio remote control that allowed you to change station from your chair. It is the original channel surfer. I saw many references to these when I was first learning about radio at that time. However, it was a very expensive radio and I have only seen one actual radio. Of course, you had to put in batteries, (big, expensive batteries). When you put your finger in the disk and then brought it around to the hook, the hook moved a little. That was a switch which turned the transmitter on so that it would transmit the proper number of pulses. As I remember the transmitting tube was a '30 or 1G4. The receiver in the radio was more complex that the radio that you listened to.

Hope this helps

Same thing around here. The big guns who ran the digi/nodes have all given up apparently. It was quite a surprise to find where I could once connect all over the east coast (Does anyone remember KA9Q's VAX down in New Jersey??) I could now connect to the K3RLI BBS and nothing else. And with what the INTERNET offers today at 28800 or faster for $19.95, I can't for the life of me figure out why the BBSes seem to be the part that survived.

6845. FS: DSP-12 Version 1.2 multi-mode communications controller (L.L. Grace)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-30 00:00:00 UTC
From: Gary O'Neil <N3GO@worldnet.att.net>
Message-ID: <5a7bkq$gid@mtinsc01-mgt.ops.worldnet.att.net>
Source record: 32699

The DSP-12 utilizes a DSP to implement the modem function and thus avoids the absolesence of conventional modems. It is at its original software version, and can be upgraded for free to the the most recent version by returning the internal PROMS with an SASE in a static proof package (aluminum foil wrap works for this) to L.L. Grace. You can also purchase new PROMS for $30 if you wish to hold onto the old set.

The DSP-12 supports 3 physical ports (HF, VHF, and UHF) which are fully multi-tasked in the software.

The modes currently supported are:

HF Packet - 300 bps AFSK 2125/2325 Hz tone pair
VHF Packet - 1200 bps AFSK 1200/2200 Hz tone pair
V26.B Packet - V26bis-compatible 2400 bps QPSK
BPSK Packet - 1200 bps BPSK modulated 1600 Hz carrier (terestrial)
PACSAT Packet - 1200 bps BPSK modulated 1600 Hz carrier (Oscar 20/16)
FO-20 Packet - Same as PACSAT with independent parameter setup.
UO-14 Packet - 9600 bps baseband
AO-13 Telemetry - Receive only mode for demodulation of OSCAR-13 BPSK telemetry signals.
RTTY: Baudot, ASCII, plus 3 additional "Extra RTTY" modes.
WEFAX APT - WEFAX demodulator.
ACARS - Aircraft Command and Reporting System (ACARS) demodulator.

Kiss, Transparent, Command, packet modes are all supported.

Power requirements: 8 - 15 VDC at 800 ma. (reverse voltage protected)

Serial I/O control - RS-232 or TTL (selectable by internal jumper)

The DSP-12 uses an Open Architecture, and a software developers toolkit is available for $25 dollars and the signing of a confidential non-disclosure agreement with L.L. Grace. This information is included in the users manual.

The DSP-12, Users Manual, Serial I/O cable, and 3 port (DIN) connectors all for $215 firm.

KANTRONICS KPC-3 AND TRIPMATE GPS INTERFACE
The following represents the efforts of WB6JAR and N6KZB, with input from WK5M, to interface the Tripmate to the Kantronics KPC-3. We found that it worked better than anticipated in satellite acquisition and direction of travel. Despite the help offered via the APRS SIG group, the following is the only set up that worked with our units.

PIN OUT CONFIGURATION
Tripmate KPC-3

pins 2&3 tied together--then both connect to---> pin 2
pin 5 connects to---> pin 7
pin 4 connects to---> pin 6

MODIFICATIONS TO KPC-3

Install a 4.7 K resistor at position R-48 to make DSR active, (see parts layout for location of R48). It is at the rear, on the board, between the DB9 and DB25 connectors.

KPC-3 COMMANDS

Refer to KPC-3 manual and Command Summary sheets for GPS version 6.0 firmware.

Abaud 4800
INTface TERMINAL, (not NEWUSER mode)
MYcall to callsign-9, (or your desired ssid)
BText is set as needed
BLt 1 through 4 to desired beacon interval in seconds
GPShead 1 through 4, must be changed to $GPRMC
GPSInit needs not to be set, (since pins 2&3 on Tripmate are tied)
LT 1 through 4 gets filled with GPS info so leave blank
LTP 1 through 4 gets set to your local area agreed upon digi paths
LTRack left to factory default
PMode left to factory default
RPrint left to factory default

Final command is INT GPS, then turn TNC off and back on with Tripmate connected. It will take about 2 minutes for first satellite acquisition.

Greetings,

I just retuned from Ghana, West Africa where my wife and I lived for two years in a rural village. There was nothing around us so we stayed in touch with the world by using the 9600 birds - particularly KO-23. HF packet may have been cheaper, but given the solar cycle, I worried about HF's reliability. Amateur operators in the U.S. transfered email from family for us. It worked out great. BTW, we powered everything by a solar (photovoltaic) system. Let me know if you want more info. Good luck.

6864. DSP base TNC recomendation

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-30 00:00:00 UTC
From: Kory Hamzeh <kory@avatar.com>

Hi,

I've been using a PK-232 for a while now and I would like to upgrade to a newer DSP based TNC. I'm mostly interested in HF weak signal work. I good CW recovery is important. I was wondering what people here would recommend. I like the spec of the SCS PT-II, but it is very expensive. Too bad AEA is screwed up because the DSP-232 looks good.

Thanks,
Kory
AC6RN

When you compare the SCS PTC-II to less expensive units, take a close
look at the hardware you are getting (processor and DSP chip
power/speed). I don't believe the DSP-232 has near the capability of the
PTC-II (even if AEA was still in business).

Your best bet would probably be to access a number of the "flying mailbox"
PacSats that fly over each point on the globe twice a day. It's
sufficient to relay BBS messages back and forth. You'll probably find
some useful info at http://www.amsat.org.

I am getting ready to buy a TNC, and want to do as much as possible on a budget. The only gear I have now is an HTX 202, so 2meter is the only packet I'll be able to do...for now. I don't know much about the Rose or Jnos stuff, as I have been out of the loop for awhile. Any help is appreciated. I am also hoping to find a TNC that comes with the needed connector for my rig, if that animal exists.
Thanx.

6874. 1 DSP transceiver

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-31 00:00:00 UTC
From: Megan Quattrocchi <megan@cgs-testing.com>
Message-ID: <32C8EC43.7F86@cgs-testing.com>
Source record: 32728

You know, I was wondering. With the latest DSP chips, would it be possible to build a transceiver with a single DSP chip with the D/A outputs and A/D inputs hooked directly to the antenna -- and a lowpass filter to prevent any signals higher than your sampling rate from coming in or going out? You'd hook another D/A output to a speaker and a A/D input to the microphone. Are these guys getting fast enough to do this?

Am I missing something about how these chips work? How hard would the programming be, and how high in frequency could you receive/transmit with such a gadget?

6875. Macintosh Computers & Ham Radio

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-12-31 00:00:00 UTC
From: john@wd1v.mv.com
Message-ID: <john-3112960734190001@wd1v.mv.com>
Source record: 32729

There is an informal group of amateur radio operators that use Macintosh computers called "Macnet" with approximately 800 members world-wide.

We stay in touch with each other via packet & Internet and we have a HyperCard stack that tells the story of each of us called "Macnet Roster" that list

o CALL SIGN @ HOME PBBS
o FULL NAME
o Street ADDRESS
o CITY, STATE, ZIP
o INTERNET ADDRESS
o MACS USED
o RADIOS USED
o SOFTWARE USED
o PASSIONS
o COMMENTS

Macnet members can then communicate with one another directly or use our Macnet Moderated Mailing List to pose comments or questions to all of us on the Net.

To join Macnet, put YOUR INFO (via EMAIL or via disk using TEACH TEXT on a formatted disk in a self addressed and stamped disk mailer that is in a large envelope clearly marked "ROSTER").

Or connect to our home page via the WWW http://www.mv.com/ipusers/wd1v

-------<sent to all new Macnet Subscribers & Macnet Roster Updates>---------

Welcome to Macnet!

The latest Macnet Roster is here as a compressed "attached" file if you are just joining Macnet or if you have just sent in an update to your stats.

Each Macnet Roster entry is in Zip Code order for USA and alphabetical order by country name for DX. You can download later versions from my home page whenever the mood strikes you.

Starting on January 1, 1997, we offer a Macnet Moderated Mailing List.
To send a message to all Macnet members on the Internet, send your message to

john@wd1v.mv.com

with "Macnet Dist." on the subject line along with your actual subject title.

Your email address will appear in the message so if you are posing a question to our group, anyone might respond directly to you or answers can be sent to me and then shared with all of us.

To be removed from the mailing list, type "Remove" on the subject title.
Only Macnet Roster entries may subscribe.

A trip to my home page reveals there are many good files and programs for amateur radio operators that want to use Mac computers. More details are in January 1997 QST, page 100. http://www.mv.com/ipusers/wd1v/
but some of our features include:

* Ham Radio Test Simulators - where you can go from Novice to Extra Class practicing the actual tests right on your Mac! Check out the info on the new NO CODE license or scramble your neurons and learn Morse on the Mac too!

* Macnet Roster - a virtual "Who's Who" HyperCard stack with more than 800 entries giving the names, addresses, phone numbers, of radio operators all over the world that are using Macs. Check out their projects and their passions and put a design on your Mac Radio future when you see what neat things are being done!

* Mac Ham Radio Software Listing - as the name implies, its "The List" of the latest - much of it with FTP links so what you see is what you can get with just a click.

* Ham Radio.FAQ - compiled on a Mac with a lot of links to great Mac FTP sites for radio, electronic engineering, and similar data.

I've done it with one of the older APRS versions on a 100LX. I'm not sure what the system requirements of the newer versions are; you might try a radio related newsgroup.

I think I had the USA map and one local map installed, as I don't have any additional memory. It did work, but was slow on the re-draw. I occasionally use the 100 LX for conventional packet use, and the portability factor far exceeds the minor drawbacks of the small keyboard and screen.

Good luck de Mike Mentuck, N1PQG

We tried this on 3 or 4 different pentium boards, only one was working correctly. Installing a multi-iocard with a 16550 chip was a good solution. Problem seems to be that not al the functions of the 16550 are implemented in silicium on the integrated chips on the new motherboards.

On a faulty motherboard everything seems to work but you won't receive anything and you can't send right either.

>the DCD mod does. Would this help me on HF?

What the DCD mod does is allow you to run open squelch on the radio.
It does this by deriving DCD from the state machine of the PAD rather
than depending on a noise squelch. This eliminates a lot of DCD falsing
on noise, and allows a shorter Txd since the delay opening the squelch
before the modem can get to work is eliminated. This squelch opening
delay can be a large percentage of the total response time of the
radio. The primary benefit you'll see on HF is a reduction in falsing
from noise bursts on the channel.

>I'm considering moving up to some kind of DSP box for higher speed
>modes. I just have to find someone to talk to in the SF Bay Area. (Berkeley)
>Is there any way to get Pactor 2 with a decent modem for less than $500?

No. Right now, the only PACTOR II system is the PTC-II at $995. There
are other non-DSP units which do a better job on PACTOR I than the PK-232
(about twice as well according to recently published tests), and there is
Clover with the HAL P-38 card for under $400. Clover performance doesn't
match that of PACTOR II, but it is well ahead of most other things. It
does offer quasi-duplex operation which is useful for some applications,
such as TCP/IP over radio via a pseudo-ppp linkage. And the P-38 is less
than half the cost of the PTC-II, which should have a significant impact
on the number of stations using it.

Also see the other thread where I talk about using PC sound cards as
DSP modems. This is an exciting direction, and one where you can
participate more initmately than just burning the plastic and plugging
together cables.

Well, it does take a bit of study to understand the construction
of signals, the various modulation forms, and the methods to
optimally decode them. But as amateurs, that's what we do.
Modulating and demodulating radio signals is what we are about,
and we should strive for an understanding of those things.
It doesn't take a graduate engineer to understand these things,
but it does take a grasp of mathematics beyond simple algebra.
I've spent more time recently reviewing the math needed to
describe the modulated signal than I have studying how to
program DSP. The latter is actually a pretty simple and
mechancial process.

>of digital signals? It's not a bad idea(I think)?

I expect we'll start seeing some of that. The manufacturers are starting
to include DSPs as more than just audio filters in the newer radios.
But for a lot of the stuff we do, the audio line out is all we need.
We feed that to the sound card and demodulate in the PC. Of course
that pretty much limits us to narrowband modulations, but that's all
the regulations let us use on HF now anyway.

If the DSP is embedded in the radio, it will be harder for us to
write code for it to try new ideas than if we're doing the DSP on
our PC. Likely we'd need an ICE, and the radio would have to be
designed to let us at the DSP. So I see that trend as something of
a mixed blessing.

I've been experimenting with a homebrew I/Q receiver, however, and
that does let you do things which are hard, or impossible, to do
with just a mono sound output to a PC. One could take the I and
Q outputs of the receiver and hook them to the stereo L and R
inputs of the sound card and do quadrature processing on the PC,
but I chose to use a DSP in the receiver itself for my experiments.
I'm using the Analog Devices EZKit DSP as the post mixer section
of the receiver (which is basically a Rick Campbell R2). That lets
me do a number of things that the orginal design's opamps couldn't
do.

I saw this, or something very like it, at Dayton last year. It is
a neat idea, but frankly I wasn't too impressed with the implementation.
It's basically just a conventional triple conversion scanner with
computer control. It doesn't make any provisions for quadrature
processing, and its tuning steps are too coarse for HF digital.
(And from my POV, the fact that it is tied fairly intimately to
Windows is a serious drawback, though that can be remedied with
a fair bit of driver work so that it would be usable on platforms
supporting real programmer friendly operating systems like Linux.)

>If a card like this ALSO have a DSP processor built-in or other
>PC card with a DSP processor with a connection for a audio cable from
>the record line out of a receiver or transreceiver ... well, I think
>that you get the picture.

The PSA chipset on the Cardinal sound cards already gives you that.
And I have a Tecmar sound card, marketed under IBM's label, which
has a TMS320C10 on board. Unfortunately, such cards are rare because
the sound card market is heading in a different direction. Of course
there is the HAL P-38 card, with a more powerful TMS320 chipset, which
can be used for DSP of HF signals. It is setup for downloading of
DSP code from the PC disk, so you can program your own modems on
it. There isn't a lot of documentation telling you how to do that,
though, and it is much more expensive than the typical sound card.

I think what we need is a basic RF front end and quadrature mixer
setup (like the R2) with computer control (perhaps a DDS LO) that
feeds I and Q to our PCs. We can then choose to either use a DSP
sound card, or just an ordinary sound card with the PC doing the
DSP, for signal processing and demodulation. That'll let us handle
arbitrary modulations in software.

There may be an advantage to including the A/D conversion step
in the radio, and feeding I and Q to the PC already digitized,
but I don't know if any sound cards for the PC support receiving
their signals that way. This might be a place for a varient of

the Winradio idea to shine. It could make the A/D converted I
and Q available on the PC's ISA bus for immediate manipulation
by software running on the PC. This could be pretty cheap too
since it is less hardware intensive than the Winradio.

I didn't choose to go this way with my experimental setup since
I didn't want the problems of shielding a sensitive receiver
in the noisy internals of the PC.

>full, now I hear only 3-4 stations after listening for hours. What's
>happened to packet while I was gone?

A couple of things happened, Mike. Low cost internet access has sapped
a lot of casual user activity from 1200 baud packet. It is horse and
buggy compared to the net at 28.8 kbs. Those who've stayed on the radio
have moved on to faster systems, 9600 baud, 19.2 kb, or 56 kb, or have
gone off to other applications beyond crude BBS systems and slow keyboard
chatting. For example, there is APRS, which uses a different frequency.
Try listening on 145.79 MHz for a while for APRS activity. Most of the
faster activity is on 70cm in most areas. You'll have to ask the active
locals exactly what and where these other things are happening in your
area.

>programming be, and how high in frequency could you receive/transmit
>with such a gadget?

Primarily what you are missing is cost. Very high speed CODECs (the
A/D and D/A component of the system) either have a very low number
of bits of resolution (that translates directly to dynamic range),
or are extraordinarily expensive.

Nyquist limits force us to sample a frequency F at a rate no less
than 2*F (and in practice we like to sample at a higher multiple
than that because it eases the brick wall filter requirement to
prevent aliasing). So to handle a signal at 30 MHz, we have to
sample at 60 MHz or higher. Reasonably priced CODECs sample at
100 kHz or less. The coming of digital video is driving the price
of faster CODECs downward, however, and a 8-bit CODEC capable of
200 MHz operation is beginning to become affordable.

The number of bits per sample also drives costs (and speed). The
more bits per sample we want, the more the CODEC costs, and the
slower it runs. As I noted, the number of bits per sample
directly translates to the dynamic range over which the CODEC
can operate. An 8-bit CODEC has 256 discrete steps, and that is
a voltage dynamic range of 48 db. The dynamic range we need from
a HF receiver spans a signal range from -140 dbm to +10 dbm, or
a range of about 150 db. An 8-bit CODEC obviously won't do. The
next step up, a 16-bit CODEC, has a dynamic range of 96 db. That's
getting better, but what we'd really like to have is a 24-bit CODEC.
That gives us a dynamic range of 144 db, and that's competitive
with the best analog receivers.

The problem is, we don't have any 24-bit CODECs, 16-bit CODECs
are mostly limited to audio rate sampling (at least the affordable
ones are), and the only CODECs that are fast enough are video CODECs

which only have 8-bit samples. Thus we have to have an analog AGC system in front of the CODEC to cope with HF dynamic range. That causes lots of problems, and of course requires more complexity between the antenna and the digital conversion step.

Now once the signal is in digital form, we want to process it, IE filter it and demodulate it. To do that, we have to perform math on the data stream. For example, to implement a reasonable FIR bandpass filter, we may need to perform 100 multiply/accumulate operations during each sample interval. If we are sampling at 60 MHz, that's 100 mul/acc operations per 17 nanoseconds. Even if we use an efficient DSP chip which can perform a multiply/accumulate operation in one T cycle, we need a T cycle time of 0.17 nanosecond, or a clock rate of 58.8 GHz for the processor. Affordable DSP processors have a clock rate of 40 MHz. And we've just implemented a bandpass filter, we haven't yet demodulated the signal. That may take a few hundred more T cycles per sample.

So both CODECs and DSP processors are about 3 orders of magnitude too slow to use directly on the signals presented at the antenna input of a HF receiver, and the dynamic range we can achieve is also several orders of magnitude too low.

Now there are other ways than a direct brute force approach. We can make aliasing work for us by sampling way below the Nyquist limit for the RF carrier (but still above the limit for the *modulation*). This will effectively recover the envelope of an amplitude modulated signal, IE AM, SSB, CW, etc. To do this, we need a sample and hold circuit in front of the A/D which will grab an integrated value of the signal during a sample period and present it to the A/D for conversion. This allows us to use an audio rate 16-bit CODEC, and allows us to use a DSP chip with a reasonable clock rate.

That's almost good enough except for one very serious flaw. With this technique, the only channel filtering we get is from the preselector filtering in the antenna input circuit. That will never do on today's crowded bands. (We can do some filtering on the recovered baseband signal, but we can't achieve single signal reception with this technique.)

There *is* a technique which will allow us to achieve single signal reception, however. The is the I/Q (or quadrature) receiver. This does require some analog circuitry in the front end of the radio (two balanced mixers and a LO), but we can sample I and Q at an audio rate and process them with a DSP of achieveable clock rate. (Amateurs may recognize the I/Q method as the phasing method of SSB generation and reception. It works on more than SSB, however. It can synthesize or demodulate any arbitrary signal. Thus it is a very powerful technique.)

I've been experimenting with such an I/Q receiver, made from
the front end of a Rick Campbell R2 and an Analog Devices EZKit
DSP board. It works. Because the CODEC on the EZKit board is only
16-bits, dynamic range is less than the better analog receivers,
so I have to use a step attenuator in front of the receiver for
manual gain control. This is less than optimum, but it has proven
workable for an experimental setup.

I can do a SSB receiver by performing a Hilbert transform (a 90
degree phase shift in the digital domain) on one of I or Q and
combining the resulting data streams. If I do the transform in
one channel, I get LSB, if I do it in the other channel instead,
I get USB. I can also do filtering of the channels to achieve a
desired bandpass response. I can also demodulate FSK and PSK
signals by using different algorithms. I can even do synchronous
AM detection. Any arbitrary amplitude, phase, or frequency modulation
can be recovered with this technique.

And conversely, I can generate any arbitrary modulation by
supplying suitably processed I and Q signals to a pair of
balanced mixers and a LO arranged as a phasing modulator,
IE the R2 in reverse. This turns out to be easier. I use
the L and R stereo outputs of a PC sound card to deliver
I and Q to the mixers. By playing a suitably processed
stereo WAV file through the sound card, I can synthesize
any M-ary coding scheme on the RF channel.

In the experimental setup, I precompute this WAV file, but
in a practical system it would be generated on the fly by
the input data (a lookup table approach is probably the least
computationally intensive way to do this).

This setup is very cheap, and requires few parts. It is a good
platform for anyone wanting to experiment with signal design
and digital signal processing.

Hi im trying to use a Baycomm style modem with an Icom IC-22A and every time i connect up the PTT line from the modem the transmitter keys. Ive tried the resistor across the xmit audio and ptt lines and a resistor in series with the ppt line and it looks like im gonna end up using a miniature relay to handle keying. Before i do tho i thought id check and see if anyone else had run across this problem. Thanks!

Art WB9HNJ

6889. XPWIN Version 1.1.4 now Available

Newsgroup: rec.radio.amateur.digital.misc

Need to know pinout on standard RS 232 25 pin serial port.
ie which pin is #1, 4, 7.
None of my references shows this info.
Tnx 73

The MFJ 1278 w/DSP only has a DSP front end filter. All the decoding is
done the normal analog way. The MFJ may be a perfectly good unit for the
money - it's not, however, in the same class as the SCS or HAL units
that do the decoding with DSP.
```

There are plenty of references around with this info:

1 - Protective ground (usually the shield on the cable)
2 - Transmit data
3 - Receive data
4 - Request to send
5 - Clear to send
6 - Data set ready
7 - Signal ground
8 - Data carrier detect
20 - Data terminal ready
22 - Ring indicator

In article <1996Dec30.114844.12251@galileo.cc.rochester.edu>,

>reliability. Amateur operators in the U.S. transfered email from family for
>us.

Unfortunately, that's not legal on the UK licence.

Take five minutes to read this and it WILL change your life.

If you want to make big bucks ($50000+) without any effords, read this article and follow the instructions!

By investing just $5, you can and WILL get thousands of dollars by the mail.

It's REALLY SIMPLE to do!!!!

STEP 1.

Invest your $5 by writing your name and address on five seperate pieces of paper along with the words: "PLEASE ADD ME TO YOUR MAILING LIST."
(In this way, you're not just sending a dollar to someone; you're payingfor a legitimate service.) Fold a $1 bill inside each paper, and mail them by standard U. S. Mail to the following five addresses:

1-Sam Coice
25550 Buckthorn Ridge Rd
Pioneer Ca 95666

2-Peg Vickmore
14905 Highway 88
Jackson, Ca 95642

3-Brian Hyson
4278 Sayoko Cr
San Jose, Ca, 95136-2335 USA

4-Andres Camacho
Rua Apodi 78
Sao Paulo, SP, 05052-010 Brazil

5-Mariano Peinado
Apdo Correos 291
03730 Javea - Alicante -
Spain

STEP 2.

Now remove the top name from the list, and move the other names up. This way, #5 becomes #4 and so on.
Put your name in as the fifth one on the list.

STEP 3.

Post the article to "at least" 250 newsgroups. Rembering that
the more that you post on, the more people see it, and
the more you will get. There are at least 30,000 newsgroups
at any given moment in time so don't be stingy.

STEP 4.

You are now in business for yourself, and should start seeing
returns within 7 to 14 days! Remember, the Internet is new
and huge. There is no way you can lose.

Now here is how and why this system works:

Out of every block of 250 posts I made, I got back about 5
responses. Yes, thats right,only 5. You make $5.00 in cash,
not checks or money orders, but real cash with your name at
#5.

Each additional person who sent you $1.00 now also makes 250
additional postings with your name at #4, 1000 postings. On
average then, 50 people will send you $1.00 with your name at
#4,....$50.00 in your pocket!

Now these 50 new people will make 250 postings each with your
name at #3 or 10,000 postings. Average return, 500 people= $500.
They make 250 postings each with your name at #2= 100,000
postings=5000 returns at $1.00 each=$5,000.00 in cash!

Finally, 5,000 people make 250 postings each with your name at
#1 and you get a return of $60,000 before your name drops off
the list.And that's only if everyone down the line makes only 250
postings each! Your total income for this one cycle is $55,000.

From time to time when you see your name is no longer on the list,
you take the latest posting you can find and start all over again.

The end result depends on you. You must follow through
and repost this article everywhere you can think of.
The more postings you make, the more cash ends up in
your mailbox. It's too easy and too cheap to pass
up!!!

So thats it. Pretty simple sounding stuff, huh? But believe me, it
works. There are millions of people surfing the net every day, all
day, all over the world. And 100,000 new people get on the net
every day. You know that, you've seen the stories in the paper.
So, my friend, read and follow the simple instructions and play
fair. Thats the key, and thats all there is to it. Print this out
right now so you can refer back to this article easily. Try to
keep
an eye on all the postings you made to make sure everyone is
playing fairly. You know where your name should be.

If you're really not sure or still think this can't be
for real, then don't do it. But please print this article and pass
it along to someone you know who really needs the bucks, and see
what happens.

REMEMBER....HONESTY IS THE BEST POLICY.YOU DON'T
NEED TO CHEAT THE BASIC IDEA TO MAKE THE BUCKS!
GOOD LUCK TO ALL, AND PLEASE PLAY FAIR AND YOU WILL
WIN AND MAKE SOME REAL INSTANT FREE CASH!

*** By the way, if you try to deceive people by posting the messages
with your name in the list and not sending the bucks to the people
already included, you will not get much. I know someone who did this
and only got about $150 (and that's after two months). Then he sent
the 5 bills, people added him to their lists, and in 4-5 weeks he had
over $10,000!

TRY IT AND YOU'LL BE HAPPY!!! :o) !!!!!!!!!!
